

WebClock

WebClock lets remote employees and contractors clock in and out wherever they are using any connected device. You have complete control to ensure tight security.

You can restrict WebClock access to one or more workstations by applying an IP address filter so employees can't log in from an unauthorized location. WebClock clears user login credentials between punches, allowing multiple employees to clock in with the same computer or tablet. Backups of employee hours data is stored offsite at a secure location.

WebClock captures employee shift information in real time so information is always up to date. Managers can see immediately if an employee failed to clock in, and they can correct staffing problems early to avoid coverage gaps and potential lapses in customer service.

WebClock also simplifies payroll by importing employee time into your payroll system.

Find out how WebClock helps you accurately track your employees' and contractors' time wherever they are.

Browser-Based

Employees can clock in and out from any internet-connected device

WebClock is the perfect solution for virtual teams, field service personnel, and those who work in multiple locations. Employees and contractors can use it to track billable hours, and it eliminates the need for temporary badges for temporary and seasonal employees.

WebClock assigns employees a unique code that they use to clock in securely via a web browser from any connected device such as a mobile phone, tablet, or laptop.

- ✓ **Clock in and out through a secure web browser**
- ✓ **No hardware or software to install**
- ✓ **Restricts access using an IP address filter**
- ✓ **WebClock clears login credentials between punches for added security**
- ✓ **Data is backed up offsite in a secure location**
- ✓ **Payroll Integration to save time and expense**
