

How to Choose the Right Statistical Tool in Prism

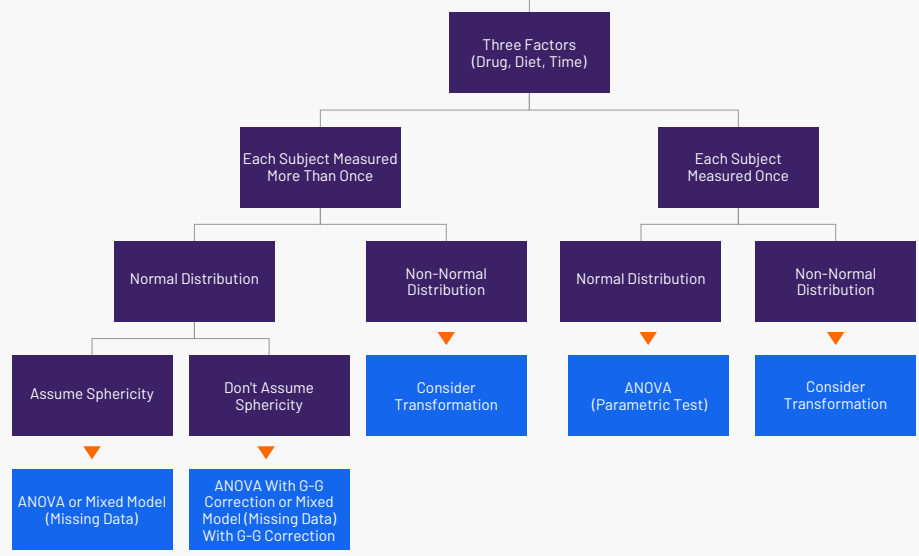

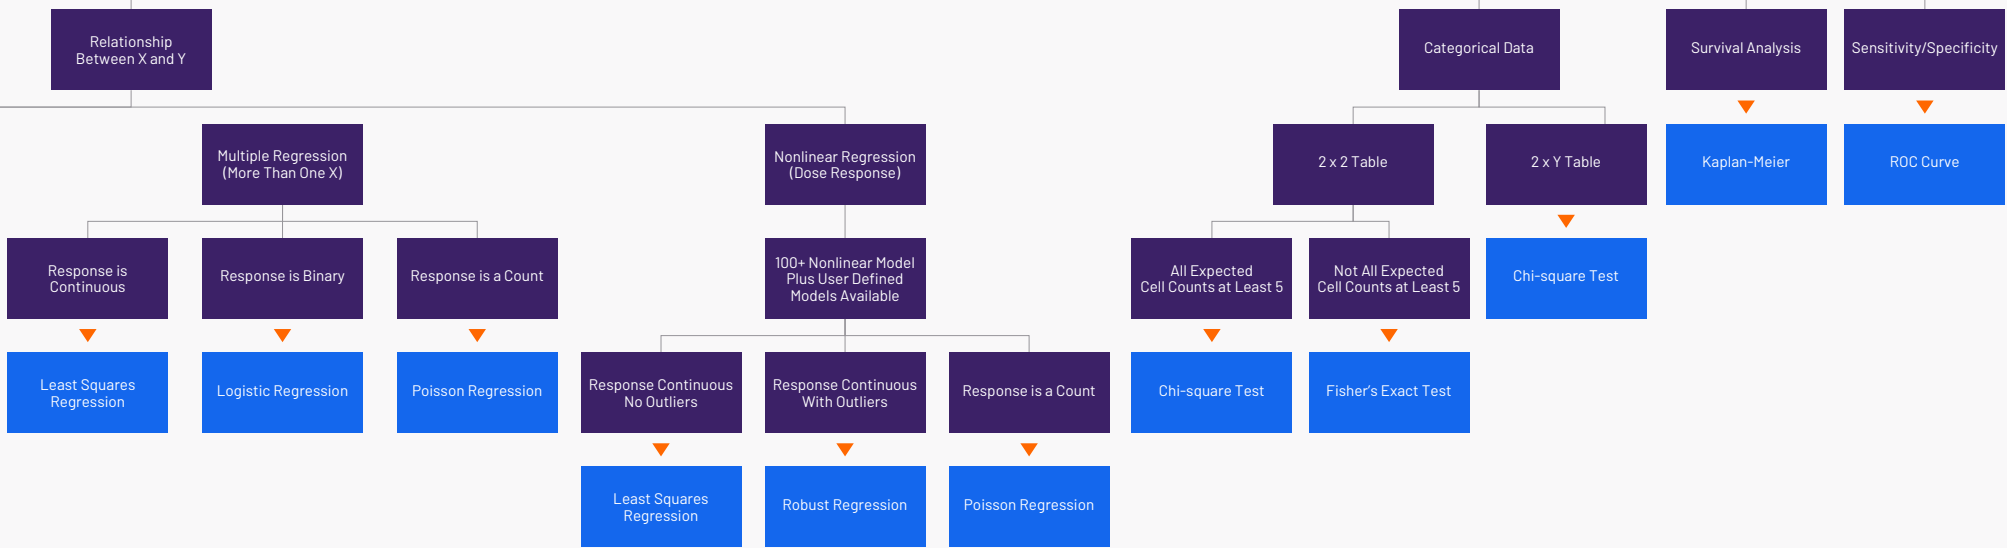

* The Mann-Whitney test is used to determine whether there are differences in the medians of your two groups and assumes the two distributions have the same shape. It can be applied to ordinal or continuous data.

** The Kruskal-Wallis test is used to determine if there are differences in the medians of your groups and assumes all the group distributions have the same shape. It can be applied to ordinal or continuous data. The Kruskal-Wallis test cannot tell you which specific groups are statistically different from each other. It only tells you whether or not at least two groups are different.
