

COVID-19 Vaccination Safety

COVID-19 VACCINES ARE SAFE & EFFECTIVE

The Known & Potential Benefits of COVID-19 Vaccine Outweigh the Known & Potential Risks of COVID-19

Clinical trials of all COVID vaccines must show they are safe & effective before approved. The known & potential benefits of a COVID-19 vaccine must outweigh the known and potential risks of the vaccine for use under what is known as an Emergency Use Authorization.

Safer Way to Build Immunity	Avoid Severe Illness	Side Effects are Normal
		
The risk of severe illness and death from COVID-19 far outweighs any benefits of natural immunity. COVID-19 vaccination will help protect you by creating an antibody (immune system) response without having to experience sickness.	COVID-19 can have serious, life-threatening complications, and there is no way to know how COVID-19 will affect you. And if you get sick, you could spread the disease to friends, family, and others around you.	Many people have reported mild side effects after COVID-19 vaccination, like pain at the injection site, a headache, chills, or fever. These are normal signs that your body is building protection and they should go away in a few days.

HOW COMMON IS ANAPHYLAXIS AFTER COVID-19 VACCINATION?

Anaphylaxis (a type of severe allergic reaction) after COVID-19 vaccination is extremely rare and has occurred in approximately 2 to 5 people per million vaccinated in the U.S. If this occurs, vaccination providers can effectively and immediately treat the reaction. To date, the CDC has not detected patterns in cause of death that would indicate a safety problem with COVID-19 vaccines.
