- 1. Both the receiver and the handset transmit and receive signals (2-way).
- During sync between the handset and the receiver "conn" is shown in the handset display.
- Handset shows the actual, real-time status of system (e.g. it shows "ON" 3. only when the pilot is lit).
- System interacts with the myfire[®] App, showing when the app is active and 4. what mode or function is currently ON.
- Handset and myfire[®] App are synchronized every 10 sec during the first 2 5. minutes – after that they are synched every 4 to 6 minutes up to 1 hour.
- Touching the handset causes an immediate sync. 6.
- 7. Self Diagnostic Function (Fault Codes)

Low Battery Receiver

supply is interrupted.

On-Demand Pilot

inactive for an extended period of time. CSA certified: 7 days. CE certified: 5 days.

Backup Batteries

fan, and WiFi function, if equipped.

Second Thermocouple Shut Off

approximately 22-29 seconds after ignition or after pushing the large flame button.

NOTE: If there is a failure due to the second thermocouple not receiving a signal, there is a 2-minute waiting period prior to the next ignition sequence. This is to allow for the gas in the system to dissipate.

With low battery power in the receiver, the system shuts off the fire completely. This will not happen if the power

This green feature eliminates energy consumption by automatically extinguishing the pilot when the appliance is

If the mains power should fail, the receiver automatically goes to battery power for all functions except the light,

Second Thermocouple Option: The system shuts off the fire when the main burner does not completely ignite in

8-hour No Motor Movement (CSA) – G6R 2010 Electronics 8-hour period. In Temperature/Timer Mode, if the ambient room temperature changes, the flame height will adjust pilot flame if the set temperature and the ambient temperature remain the same over a 8-hour period. **3-hour No Communication Function – SYMAX Electronics**

The fire will continue to function normally when communication is restored.

© 2019 Maxitrol Company, Mertik Maxitrol GmbH & Co. KG, All Rights Reserved

Manual Mode/Temperature/Timer Mode: The valve will turn to pilot if there is no change in flame height for a

automatically to maintain set temperature, and the fire will continue to function normally. The valve will turn to

The valve will turn to pilot flame if there is no communication between handset and receiver for a 3 hour period.

Receiver Overheating Turn Down

- Receiver recognizes that there are batteries installed with in the receiver itself. If the receiver temperature rises above 60°C then it will shutdown to pilot.
- If the application uses a remote battery pack or AC Mains adapter the system will shut down at 80°C.
- The product will start operating normally once the temperature has reduced below the activation temperature.

1-hour Turn Down for Bedroom Fires

Valve turns to pilot flame if there is no change in burner flame height over a 1-hour period.

Pilot Adjustment Screw (for vented units only)

Clockwise = Decrease Counterclockwise = Increase

© 2019 Maxitrol Company, Mertik Maxitrol GmbH & Co. KG, All Rights Reserved

Adjusting the Pressure Regulator (for Vented Units Only)

Turn the adjustment screw to set required burner pressure (high fire). Pressure is increased by turning clockwise or decreased by turning counterclockwise. This adjustment is required for fuel conversions.

Conversion Plug

Convertible regulators are designed to deliver either of two fixed outlet pressures for Natural Gas (NG) or LP Gas. To change from one gas to the other, turn the conversion plug counter clockwise and remove it from the valve. Unsnap and remove the plastic part of the conversion plug, rotate it 180°, and then slide it back onto the conversion plug until it snaps. Insert the conversion plug into the valve and turn it clockwise until it bottoms out.

Gas Flow Through Valve

MERTIK MAXITROL

When threads are tightened, the valve must be held at the designated clamping points.

WARNING: Never clamp the valve across the stepper motor. Permanent damage to the motor will result and the valve will not function properly.

Control Valve Components

Proper Handling of GV60 Valve

Control Valve Components

Thermocouple Circuit Interrupter

Installation:

- 1. Tighten brass interrupter block into valve ¼ turn beyond finger tight. If necessary, an additional ¹/₄ turn is possible.
- **CAUTION:** Further tightening will damage the plastic sleeve in the brass interrupter block and can cause a short in the circuit.
- **NOTE:** Do not over-torque or under-torque the interrupter block to achieve a specific slot alignment.

Control Valve Components

Thermocouple Circuit Interrupter

Threading the male end of the thermocouple into the interrupter block as recommended results in a smooth surface contact area as seen in Figure 1.

WARNING:

Over-tightening the thermocouple can damage the thermocouple and decrease the available surface area, which results in much higher resistance. Over-tightening can also damage the insulating washer at the base of the thermocouple as seen in Figure 2.

Both situations can result in the pilot dropping out and/or nuisance shutoffs.

The receiver module is not only a battery box. It is the system processor.

Synchronizing the Receiver and Handset

- Press and hold the receiver's reset button until you hear one short beep followed by one long beep. After the long beep, release the reset button.
- Within the subsequent 20 seconds press the small flame button on the handset until you hear two additional short beeps coming from the receiver confirming the code is set. If you hear one long beep, this indicates the code learning sequence has failed or the wiring is incorrect. There are 65,000 random codes to select from.
- **NOTE:** This is a one time setting only, and is not required after mains power failure or changing the batteries of the handset or receiver.

Receiver Components

Setting the Electronics Code

Synchronizing the Receiver and the Puck

- Press and hold the receiver's reset button until you hear one short beep followed by one long beep. After the long beep, release the reset button.
- Within the subsequent 20 seconds press the low flame button on the Puck until you hear two additional short beeps coming from the receiver confirming the code is set. If you hear one long beep, this indicates the code learning sequence has failed or the wiring is incorrect. There are 65,000 random codes to select from.
- **NOTE:** This is a one time setting only, and is not required after mains power failure or changing the batteries of the Puck or receiver.

WARNING:

NEVER connect a 9-Volt battery directly to the cable of the remote battery box. This connection is only to be used to connect the receiver to the remote battery box.

www.mertikmaxitrol.com

Battery Removal Ribbon

Make certain that the ribbon is positioned under the batteries and that the tab is exposed.

Batteries: 4 x 1.5V "AA" (quality alkaline recommended)

NOTE: Always check for proper battery installation.

WARNING: Donotusemetal objects (screwdrivers, knives) to remove batteries. This could cause damage to the receiver battery compartment. Use the battery removal ribbon. Battery replacement is recommended at the beginning of each heating season. Dead or old batteries should be removed immediately. If left in the unit the batteries can overheat, leak and/or explode. New and old batteries and different brands of batteries should not be used together. Mixing of various batteries can cause the batteries to overheat, leak and/or explode.

WARNING:

The thermocouple interrupter circuit is polarity sensitive. Make certain the red cable (1/4") is connected to the red terminal, and the yellow cable (3/16") is connected to the yellow terminal. Verify that the connections are tight.

Potential Problem: The appliance will not light with the handset.

TEST THE VALVE

TEST: Verify that the MANUAL knob is in the ON position.

PROCEDURE: Visually inspect MANUAL knob position.

RESULT: MANUAL knob should be rotated into, the ON position. The knob will "click" when it is engaged correctly.

© 2019 Maxitrol Company, Mertik Maxitrol GmbH & Co. KG, All Rights Reserved

Troubleshooting the GV60

Testing the Valve

CORRECT. MANUAL knob should be fully in the ON position.

INCORRECT.

MANUAL knob is not fully in the ON position. The GV60 will not operate properly with the knob in this position.

TEST: Manually light the fireplace to verify the gas supply is sufficient.

PROCEDURE: Turn MANUAL knob to MAN. Insert small tool and depress the plunger. Light pilot and hold the plunger for 10 seconds. Turn knob back to ON.

RESULT: If the manual light is successful, test the electronics.

GV60 Troubleshooting

TEST THE BATTERIES

TEST: Check batteries for proper voltage.

PROCEDURE: Connect "+" test probe to the pin on the far left of the 5-wire connector. Connect "-" test probe to ground, e.g. valve body or appliance chassis.

RESULT: The reading should be 5 – 6 VDC.

Troubleshooting the GV60

Testing the Batteries

GV60 Troubleshooting

TEST THE INITIAL RECEIVER OUTPUT

Do you hear a "clunk" when the impulse magnet engages?

TEST: Test the initial receiver output.

PROCEDURE: Connect "+" test probe on yellow wire. Connect "–" test probe to ground, e.g. valve body or appliance chassis.

RESULT: The reading should be 5+ mV at the yellow wire as the batteries power the electromagnet.

© 2019 Maxitrol Company, Mertik Maxitrol GmbH & Co. KG, All Rights Reserved

Troubleshooting the GV60

Verifying Ground with Gas Valve

Troubleshooting the GV60

© 2019 Maxitrol Company, Mertik Maxitrol GmbH & Co. KG, All Rights Reserved

Troubleshooting the GV60

TEST: Test the thermocouple interrupter circuit by taking a mV reading at the yellow terminal.

PROCEDURE: Connect "+" test probe on yellow wire. Connect "-" test probe to ground, e.g. valve body or appliance chassis. Subtract mV reading from test on the red wire (see previous slide) from current reading on the yellow wire.

RESULT: The difference is the power being consumed by the receiver. A minimum of 5 mV is required for proper operation.

TEST GAS PRESSURE

TEST: Check gas pressure at pressure test ports on valve.

PROCEDURE: The pressure test ports use a captured screw. It will not fall out, but it must be retightened after checking both inlet and manifold pressure.

IMPORTANT: Check pressure test ports for leaks after test is complete.

RESULT: Gas pressures should match those below.

NOTE: Always check gas pressure at full flow.

© 2019 Maxitrol Company, Mertik Maxitrol GmbH & Co. KG, All Rights Reserved

Testing Gas Pressure

- Two RGB outlets
- Much smaller footprint and easy installation
- Identical connectors on both ends of cable
- Communication/Wi-Fi Chip is approved by Apple, Amazon, and Google.
- More memory
- Increased processing speed
- Temperature sensor
- Fewer steps for myfire[®] app setup.
