

MDaemon 21 - New Feature Highlights

The following information provides a quick overview of new features end users and IT administrators will find useful. A more comprehensive list of fixes and new features can be viewed in the MDaemon Release Notes.

New Features and Improvements

Virus/Spam Misclassification Reporting for Improved Filtering Accuracy

A right-click popup menu option was added to the Quarantine, Bad Queue, and Spam Trap queue screens in the MDaemon console and Remote Administration to report improperly classified spam or non-spam messages to MDaemon.com as false negatives or false positives. The messages will be analyzed and passed along to third-party vendors for corrective action.

New Graphical User Interface for the ActiveSync Migration Client

The ActiveSync Migration Client has been updated with a graphical user interface for simplified migration from other mail servers that support ActiveSync.

MDaemon Instant Messenger - Persistent Chat Rooms

MDaemon Instant Messenger now supports persistent chat rooms, which do not need to be recreated every time all users leave the room.

Instant Messenger & Other Improvements in MDaemon Webmail Mobile Theme

The MDaemon Webmail Mobile Theme includes a variety of new features, including the MDaemon Instant Messenger client, auto-complete, saved search folders, Dropbox integration features, message threading, scheduling assistant, and much more. For a complete list, please see the MDaemon release notes.

Other MDaemon Webmail Improvements

Users can now attach an event to a new email via the right-click menu in the LookOut and WorldClient themes, and from the event preview in the Mobile theme.

The Advanced Search feature now includes the ability to search within the CC field.

Clustering Improvements with Multi-Node Mail Routing

MDaemon's clustering service now includes multi-node mail routing, where mail queues are shared between the cluster nodes. Having multiple servers process and deliver the messages allows them to split the work more evenly and prevents messages from being stuck in the queues of any servers that are down. SSL certificates are replicated from the primary to secondary nodes.

Improved IMAP Filters

IMAP filtering rules can now search within the message body for particular text.

Remote Administration Styling Updates & Other Improvements

- Styling updates have been added to the status page tables, disk usage statistics, traffic charts, graphs, and reports.
- An “Explanation” column has been added to the Quarantine queue list to help administrators more easily identify why a message was placed in the quarantine.
- The ability to manage the RAW queues has been added under Messages and Queues | RAW Queue.
- Administrators can now use Remote Administration to access the Webmail Custom Links manager via Main | Webmail Settings | Custom Links (for global administrators) and Main | Webmail Custom Links (for domain administrators). This allows administrators to add custom buttons to the MDaemon Webmail toolbar.
- New "Release All" and "Requeue All" buttons have been added to the Queue managers at Messages and Queues | Deferred Queue, Holding Queue, Quarantine Queue, and Spamtrap Queue.
- The VBR Certification Setup page has been added under Security | Sender Authentication | VBR Certification "Configure a domain for message certification".

For a complete list of new features & updates, please see the [MDaemon release notes](#).

Please note the following branding changes. SecurityPlus is now MDaemon Antivirus. Outlook Connector is now MDaemon Connector for Outlook, WorldClient is now MDaemon Webmail, and ActiveSync is now MDaemon ActiveSync.
