How XcellHost Works

Servers

Add and tag droplets via the DigitalOcean API.

Groups

Organize droplets. You may choose to create groups based on role, location, or any other criteria.

Recipes

Recipes are containers of commands that are fully versioned. Recipes can be written in bash, terraform, perl, python, ruby, go, or node.js.

Files

Files is a centralized place to store text or binary files & then automatically SCP them to droplets via recipes.

Execute

Run recipes on groups of droplets & visualize results. Results are coalesced and stored.

Users

Control and monitor access to droplets. Add team members for a complete audit trail of all activity within XcellHost & DO
