

# Q-LINK <br> VARIABLE FREQUENCY DRIVE 

Base Drive, Bypass Drive,
Drive with Disconnect
200~480V (3~28A)

# Installation, Programming Operation, \& Maintenance Manual <br> v2.00.09.17 

## 4 1 <br> CAUTION, SAFETY WARNING

As with all electrical products, read manual thoroughly before operating. Only qualified, expert personnel should perform maintenance and installation. Contact the nearest authorized service facility for examination, repair, or adjustment. Do not disassemble or repair unit; death or injury due to electrical shock or fire hazard may result.

Product improvement is a continual process at Franklin Control Systems. Specifications and manual data subject to change. Consult factory for additional information.

## SAFETY INSTRUCTIONS

To prevent injury and property damage, follow these instructions during the installation and operation of VFD.

Incorrect operation due to ignoring these instructions may cause harm or damage to personnel and/or equipment. The following symbols are used throughout the manual to highlight important information.

## DANGER

This symbol indicates death or serious injury can occur if you do not follow instructions.

## $\wedge$ WARNING

This symbol indicates the possibility of death or serious injury.

## $\triangle$ CAUTION

This symbol indicates the possibility of damage to VFD or other components.

- The meaning of each symbol in this manual and on your equipment, is as follows.

This is the safety alert symbol.
Read and follow instructions carefully to avoid a dangerous situation.
This symbol alerts the user to the presence of "dangerous voltage" inside the product that might cause bodily harm or electric shock.

This manual should be given to the person who actually uses the VFD and is responsible for its maintenance.

## WARNING

Do not remove VFD cover for wiring or periodic inspections while power is applied or the unit is in operation.
Otherwise, electric shock could occur.
$\square$ Wiring and periodic inspections should be performed at least 5 minutes after disconnecting the input power with DC link voltage below 30VDC.
Otherwise, electric shock could occur.
$\square$ Operate VFD and control devices with dry hands.
Otherwise, electric shock could occur.
Do not use VFD if power or motor cable is damaged. Otherwise, electric shock could occur.

## CAUTION

$\square$ Install VFD on a non-flammable surface. Do not place flammable materials nearby.
Otherwise, fire could occur.
$\square$ Disconnect the input power if VFD has been damaged. Otherwise, it could result in a secondary accident and fire.
$\square$ Do not touch VFD after shutting down or disconnecting it. It can remain hot for a few minutes. Otherwise, bodily injuries such as skin-burn or damage could occur.
$\square$ Do not apply power to a damaged VFD or to VFD with missing parts.
Otherwise, electric shock could occur.
$\square$ Do not allow lint, paper, wood chips, dust, metallic chips or other foreign material into the drive.
Otherwise, fire or accident could occur

## PRECAUTIONS

## (1) Handling and installation

- Check VFD environmental conditions and electrical requirements before purchasing VFD.
- Do not stack VFD boxes higher than standard 48 " cube height when palletizing for storage.
- Do not place heavy items on VFD.
- Install and wire VFD according to the instructions in this manual.
- Do not open the cover during delivery.
- Do not drop VFD or subject it to hard impact.
- Take protective measures against ESD (Electrostatic Discharge) before touching control boards during inspection, installation or repair.

## (2) Wiring

- Input power wires should be connected to R/L1, S/L2 and T/L3 VFD terminals for three-phase.
- Power Ground and Motor Ground should be connected to a VFD ground terminal.
- Do not connect power factor correction capacitors, surge suppressors, or RFI filter to the VFD output.
- The phase sequence on VFD terminals $\mathrm{U} / \mathrm{T} 1, \mathrm{~V} / \mathrm{T} 2, \mathrm{~W} / \mathrm{T} 3$ to motor will affect the direction of motor rotation. The input power phase sequence does not affect a direction of motor rotation.
- Incorrect VFD terminal wiring could result in VFD and/or equipment damage.
- Reversing the polarity (+/-) of the digital control terminals can damage VFD.
- Perform wiring after VFD has been mounted. Otherwise, electric shock or bodily injury can occur.
- Do not modify VFD internal components or circuits.

## (3) Start-up

- $\quad$ Check if input power voltage is within acceptable range before applying power to VFD
- Check all the motor data and control parameters when VFD is powered. Some parameter values might require adjustment depending on the application.
- Start VFD in forward direction and check the motor rotation. Swap any two motor leads to change the motor rotation when VFD power is off. It is not recommended to correct motor rotation by using reverse start command to run motor forward.
- Run motor up to full speed and check if system has resonance frequencies (vibration) in the normal speed range. Make notes at what frequencies the vibration started and stopped. Set these frequencies in Skip Frequency parameters to prevent a system vibration.
- $\quad$ Check the motor run current on VFD display while running at full speed and if it is higher than motor FLA, check motor wiring and for any mechanical problems (valves, dampers, etc.) that could create extra load on motor shaft.

## (4) Operation

- When the Auto restart function is selected, VFD can restart multiple times automatically during operation.
- If restart after fault reset is selected, the VFD can start automatically after fault reset.
- Do not modify VFD internal components and circuits.
- Set correct motor data from the motor nameplate and overload protection parameters for proper motor overload protection.
- The use of any disconnecting device (contactor, disconnect etc.) in motor circuit during VFD run can cause a damage of VFD power components. Stop VFD before opening the motor circuit with disconnect or contactor.
- Power factor capacitors and generators may become overheated and damaged due to harmonics distortion created by VFD.
- Use, if possible, an inverter rated motor or motor with insulation class "F" or higher. The VFD generates high frequency output pulses with spikes, which can deteriorate motor winding insulation and eventually damage the motor. The longer distance to the motor the higher amplitude of these voltage spikes will be applied to motor winding. Any cables with paralleled wires will increase the amplitude of these spikes at motor terminals.
- Install output reactor or filter to protect motor winding insulation based on distance range from VFD to a motor specified in section 2.3-Basic Configuration. Install an output reactor for shorter distance than specified on page 3-7 if motor is old or if insulation class is lower than " F ".
- VFD can operate motor at frequencies higher than 50 HZ or 60 Hz . Verify the maximum allowed speed with motor and machinery manufacturers prior to increasing a VFD output frequency because it can overheat motor or damage machinery.

## (5) Safety

- If required, provide an emergency mechanical brake to prevent any hazardous conditions if VFD fails during operation.
- Some VFD parameters are set as default to automatically start VFD in some applications. Disable these parameters if automatic start is not safe for personnel or equipment.

## (6) Maintenance, Inspection and Parts Replacement

- Disconnect all motor leads from VFD before checking the motor insulation with a megohmmeter. The Megger tester 1000VDC output can damage the VFD power components.
- Refer to Chapter 9 for periodic inspection and parts replacement details.

## (7) Disposal

- Dispose of VFD properly as industrial equipment waste.

## CHAPTER 1 - PRODUCT OVERVIEW

### 1.1 Introduction

The Quick Link (Q-Link) variable frequency drive (VFD) provides a higher quality user experience. Q-Link features an organic light emitting diode (OLED) display, with an easy to use control interface and onboard navigation menu.

Q-Link's iOS and Android applications interface affords secure Bluetooth connectivity for the added convenience of device monitoring and increased serviceability response times. Q-Link's mobile app allows users to commission, monitor, and initiate automated VFD reports.
iOS App Store: http://apple.co/2xdGHZN Google Play Store: http://bit.Iy/2wyZFgi

### 1.2 Q-Link VFD Models

- Q-Link Base Drive: Current rated stand-alone VFD.

- Q-Link Smart Bypass: Current rated drive, with integrated smart bypass.

- Q-Link Drive with Disconnect: Current rated drive, with integrated disconnect switch.

- Q-Link HP Rated Drive: HP rated stand-alone VFD.

## CHAPTER 2 - BASIC INFORMATION

### 2.1 Part Number Code and Initial Inspection

2.1.1 Part Number Anatomy

Amperage Rated VFD (Base Drive, Smart Bypass, and Drive with Disconnect)

### 2.1.2 UL Label

### 2.2 VFD Unpacking and Inspection

Remove VFD from its packing and inspect its exterior for shipping damage. If there is damage, notify the shipping agent and your FCS (Franklin Control Systems) sales representative.

Step 1. Verify the part-number and product ratings on the identification label are correct and that the shipping box is not visiably damaged.

Step 2. Open box and verify the VFD is still in the foam shipping blocks and plastic wrap, and that the quickstart guide is included in the box.

Step 3. Remove VFD from the box and foam shipping blocks, determine if the VFD is undamaged and the plastic overwrap is unopened.

(Figure 2.2.1)
Remove the VFD cover and inspect VFD for any damage or foreign objects. Check VFD part number, current rating and nominal voltage on the sticker attached to the side of the VFD. Verify if VFD electrical and environmental ratings are correct and adequate for the application.

### 2.3 Basic Configuration

The following are the most common devices used in motor control branch operated by VFD. Adequate peripheral devices must be selected and correct connections made to ensure proper VFD operation. An incorrectly applied or installed VFD can result in system malfunction or reduction in product life as well as component damage. You must read and understand this manual thoroughly before proceeding with installation.

Note: Do not install magnetic contactor in the motor circuit for start/stop or emergency stop purpose. Opening the motor circuit when VFD runs at above $50 \%$ its rated capacity can cause VFD power components failure.

## CHAPTER 3 - SPECIFICATIONS

### 3.1 Standalone VFD Ratings

Standalone VFD - 200-480

| Part Number | HP |  |  | Input <br> Current | Output <br> Current |
| :---: | :---: | :---: | :---: | :---: | :---: |
| QLNK-003-DV | 0.5 | 0.5 | 1 | 2.4 | 3 |
| QLNK-005-DV | 1 | 1 | 3 | 4 | 5 |
| QLNK-009-DV | 2 | 2 | 5 | 7.2 | 9 |
| QLNK-012-DV | 3 | 3 | 7.5 | 9.6 | 12 |
| QLNK-017-DV | 5 | 5 | 10 | 13.6 | 17 |
| QLNK-024-DV | 5 | 7.5 | 15 | 19.2 | 24 |
| QLNK-028-DV | 7.5 | 10 | 20 | 22.4 | 28 |

### 3.2 VFD Smart Bypass Ratings

| VFD Smart Bypass $-\mathbf{2 0 0} \mathbf{- 4 8 0}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| HP |  |  |  |  |  |
| Part Number | 208V | 230V | 480 V | Input <br> Current | Output <br> Current |
| QLNK1-BYP003-DV | 0.5 | 0.5 | 1 | 2.4 | 3 |
| QLNK1-BYP005-DV | 1 | 1 | 3 | 4 | 5 |
| QLNK1-BYP009-DV | 2 | 2 | 5 | 7.2 | 9 |
| QLNK1-BYP012-DV | 3 | 3 | 7.5 | 9.6 | 12 |
| QLNK1-BYP017-DV | 5 | 5 | 10 | 13.6 | 17 |
| QLNK1-BYP024-DV | 5 | 7.5 | 15 | 19.2 | 24 |
| QLNK1-BYP028-DV | 7.5 | 10 | 20 | 22.4 | 28 |

### 3.3 VFD with Disconnect Ratings

VFD with Disconnect - 200-480

| Part Number | HP |  |  | Input <br> Current | Output <br> Current |
| :---: | :---: | :---: | :---: | :---: | :---: |
| QLNK1-DISC003-DV | 208V | 230V | 480 V | 0.5 | 1 |
| 2.4 | 3 |  |  |  |  |
| QLNK1-DISC005-DV | 1 | 1 | 3 | 4 | 5 |
| QLNK1-DISC009-DV | 2 | 2 | 5 | 7.2 | 9 |
| QLNK1-DISC012-DV | 3 | 3 | 7.5 | 9.6 | 12 |
| QLNK1-DISC017-DV | 5 | 5 | 10 | 13.6 | 17 |
| QLNK1-DISC024-DV | 5 | 7.5 | 15 | 19.2 | 24 |
| QLNK1-DISC028-DV | 7.5 | 10 | 20 | 22.4 | 28 |

### 3.4 VFD HP-Rated Ratings

VFD HP-Rated - 200-480

| Part Number | HP |  |  |
| :---: | :---: | :---: | :---: |
| Input Current | Output Current |  |  |
| QLNK-000-HPR-DV | 0.5 | 2.4 | 3 |
| QLNK-001-HPR-DV | 1 | 4 | 5 |
| QLNK-002-HPR-DV | 2 | 7.2 | 9 |
| QLNK-003-HPR-DV | 3 | 9.6 | 12 |
| QLNK-005-HPR-DV | 5 | 13.6 | 17 |
| QLNK-007-HPR-DV | 7.5 | 22.4 | 28 |

### 3.5 Standalone and HP-Rated VFD Torque Ratings

| VFD Part Number | Input Power |  | Output Power |  | Mounting Screw Size |  | Control Terminals |  | Option Board Terminals |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Wire Size | Screw Torque | Wire Size | Screw Torque | Mounting Screw | Screw Torque | Wire Size | Screw Torque | Wire Size | Screw Torque |
| QLNK-003-DV-QLNK-028-DV | 18-8AWG | 14in-lb | 18-8AWG | 14in-lb | \#10 | 15in-lb | 30-12AWG | 4.5in-lb | 24-12AWG | $4.5 \mathrm{in}-\mathrm{lb}$ |
| QLNK-003-HPR-DV- <br> QLNK-028-HPR-DV | ( $1-10 \mathrm{~mm}^{2}$ ) | (1.6Nm) | ( $1-10 \mathrm{~mm}^{2}$ ) | (1.6Nm) | (M5) | (1.7Nm) | (0.2-2.5mm²) | (0.51Nm) | (0.5-2.5mm²) | (0.5NM) |

### 3.6 VFD Smart Bypass Torque Ratings

| Part Number | Input Power |  | Output Power |  | Mounting Screw Size |  | Control Terminals |  | Option Board Terminals |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Wire Size | Screw <br> Torque | Wire Size | Screw Torque | Mounting Screw | Screw Torque | Wire Size | Screw Torque | Wire Size | Screw <br> Torque |
| QLNK1-BYP003-DV-QLNK1-BYP005-DV | $\begin{gathered} \text { 18-8AWG } \\ \left(1-10 \mathrm{~mm}^{2}\right) \end{gathered}$ | $\begin{aligned} & \text { 22in-lb } \\ & (2.5 \mathrm{Nm}) \end{aligned}$ | 18-10AWG <br> (1-6mm²) | $\begin{gathered} \text { 20in-lb } \\ (2.25 \mathrm{Nm}) \end{gathered}$ | $\begin{aligned} & \# 10 \\ & \text { (M5) } \end{aligned}$ | $\begin{gathered} 15 \mathrm{in}-\mathrm{lb} \\ (1.7 \mathrm{Nm}) \end{gathered}$ | $\begin{gathered} 30-12 A W G \\ \left(0.2-2.5 \mathrm{~mm}^{2}\right) \end{gathered}$ | $\begin{gathered} 4.5 \mathrm{in}-\mathrm{lb} \\ (0.51 \mathrm{Nm}) \end{gathered}$ | $\begin{aligned} & \text { 24-12AWG } \\ & \left(0.5-2.5 \mathrm{~mm}^{2}\right) \end{aligned}$ | $4.5 \mathrm{in}-\mathrm{lb}$ <br> (0.5NM) |
| QLNK1-BYP009-DV |  |  | 16-10AWG <br> ( $1.5-6 \mathrm{~mm}^{2}$ ) |  |  |  |  |  |  |  |
| QLNK1-BYP012-DV |  |  | $\begin{gathered} 16-8 \mathrm{AWG} \\ \left(1.5-10 \mathrm{~mm}^{2}\right) \end{gathered}$ |  |  |  |  |  |  |  |
| QLNK1-BYP017-DV |  |  | $\begin{gathered} 14-8 \mathrm{AWG} \\ \left(2.5-10 \mathrm{~mm}^{2}\right) \end{gathered}$ |  |  |  |  |  |  |  |
| QLNK1-BYP024-DV |  |  | $\begin{gathered} 12-8 \text { AWG } \\ \left(2.5-10 \mathrm{~mm}^{2}\right) \end{gathered}$ |  |  |  |  |  |  |  |
| QLNK1-BYP028-DV |  |  | $\begin{gathered} \text { 8-6AWG } \\ \left(10-16 \mathrm{~mm}^{2}\right) \end{gathered}$ | $\begin{aligned} & 35 \mathrm{in}-\mathrm{lb} \\ & (4 \mathrm{Nm}) \end{aligned}$ |  |  |  |  |  |  |

### 3.7 VFD Disconnect Torque Ratings

VFD with Disconnect - Wire Size \& Torque Ratings

| VFD Part Number | Input Power |  | Output Power |  | Mounting Screw Size |  | Control Terminals |  | Option Board Terminals |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Wire Size | Screw Torque | Wire Size | Screw <br> Torque | Mounting Screw | Screw Torque | Wire Size | Screw Torque | Wire Size | Screw Torque |
| QLNK1-DISC003-DV- <br> QLNK1-DISC028-DV | $\begin{aligned} & \text { 18-8AWG } \\ & \left(1-10 \mathrm{~mm}^{2}\right) \end{aligned}$ | $\begin{aligned} & 22 \mathrm{in}-\mathrm{lb} \\ & (2.5 \mathrm{Nm}) \end{aligned}$ | $\begin{aligned} & \text { 18-8AWG } \\ & \left(1-10 \mathrm{~mm}^{2}\right) \end{aligned}$ | $\begin{gathered} 14 \mathrm{in}-\mathrm{lb} \\ (1.6 \mathrm{Nm}) \end{gathered}$ | $\begin{aligned} & \# 10 \\ & \text { (M5) } \end{aligned}$ | $\begin{gathered} \text { 15in-lb } \\ (1.69 \mathrm{Nm}) \end{gathered}$ | $\begin{gathered} 30-12 \mathrm{AWG} \\ \left(0.2-2.5 \mathrm{~mm}^{2}\right) \end{gathered}$ | $\begin{gathered} 4.5 \mathrm{in}-\mathrm{lb} \\ (0.51 \mathrm{Nm}) \end{gathered}$ | $\begin{gathered} 24-12 A W G \\ \left(0.5-2.5 \mathrm{~mm}^{2}\right) \end{gathered}$ | $\begin{aligned} & 4.5 \mathrm{in}-\mathrm{lb} \\ & (0.5 \mathrm{NM}) \end{aligned}$ |

### 3.8 Standalone and HP-Rated VFD Dimensions

### 3.9 Smart Bypass and VFD with Disconnect Dimensions

### 3.10 Common Specifications

| Input Ratings | Voltage | 200-480V (+15\%/-10\%) |
| :---: | :---: | :---: |
|  | Frequency | 50/60 (+/-5\%) |
|  | Efficiency | >= 98\%, full load and full voltage |
|  | Displacement Power Factor | >. 99 |
| Output Ratings | HP | 1-10 HP (200V), 1-20HP (460V) |
|  | Frequency | $0-240 \mathrm{~Hz}$ |
|  | Voltage | 0-100\% of Supply Voltage |
| Control | Control Method | V/F Scalar Pulse Width Modulation |
|  | Carrier Frequency | $2 \mathrm{kHz}-10 \mathrm{kHz}, 0.1 \mathrm{kHz}$ resolution, Default 2.5 kHz |
|  | Output Frequency Resolution | 0.01 Hz |
|  | Frequency Accuracy | Digital: 0.01 \% of Max. Output Frequency Analog: 1 \% of Max. Output Frequency |
|  | V/F Ratio | Linear, Squared Pattern |
|  | Overload Capacity | 110\% for 60s |
| Operation | Operation Method | OLED display and keypad, HOA buttons, Terminals, Bluetooth mobile app, Communications |
|  | Frequency Setting | Keypad, Analog Voltage and Current 0-10V, 4-20mA, Bluetooth mobile app, Communications |
|  | Programming Method | OLED display and keypad, Bluetooth mobile app, Communications |
|  | PID | Standard |
|  | Communications Interface | Physical (RS-485, Bluetooth) <br> Protocols (Native BACnet MS/TP, Modbus RTU) |
|  | Logging | Faults/Alarms/Parameter Changes - w/ Real Time \& Date) |
|  | Indication | 3 LEDs: Hand, Off, Auto |
|  | Operation Functions | Frequency Limit, Skip Frequencies, Reverse Rotation Prevention, Auto Restart, Flying Start, Damper Control, Motor Pre-Heat, Torque Boost, Stall Prevention, DC Trip Prevention, DC Braking, DC Start, Analog Signal Loss, Auto Bypass (Bypass models only), Fireman's override, Auto Fault Restart |

### 3.11 I/O Specifications

| Dry Inputs | Count | 4 configurable (NO or NC) |
| :---: | :--- | :--- |
|  | Programmable Inputs | None / Enable / Fireman's Override / Speed- A / Speed- B / <br> Setpoint-A / Setpoint-B / Damper LSW / Flow Switch / <br> External Trip / Run Forward / Run Reverse / 2nd Acc/Dec <br> Time / 3-Wire Start / 3-Wire Stop / HOA Auto / HOA Hand <br> Shutdown / Fault Reset / Bypass / Switch 1A to 2A/3A |
|  | Max Rating | Programmable Inputs |

### 3.12 Environment

VFD's are to be used in a controlled environment. The following table lists the Q-Link VFD's environmental requirements:

| Environmental | Ambient Temperature | -10 to $40^{\circ} \mathrm{C}\left(104^{\circ} \mathrm{F}\right), 50^{\circ} \mathrm{C}\left(122^{\circ} \mathrm{F}\right)$ by following De-rating table on Appendix A |
| :---: | :---: | :---: |
|  | Storage Temperature | -20 to $65^{\circ} \mathrm{C}\left(149^{\circ} \mathrm{F}\right)$ |
|  | Location | Pollution Degree 2 Environment |
|  | Altitude | 1000m (3280ft) above sea level. De-rate $10 \%$ for installations up to 2000 m ( 6560 ft ). Additional $20 \%$ for installations $2000-3000 \mathrm{~m}$ (6560-9840ft). |
|  | Relative Humidity | 95\% Relative Humidity (non-condensing) |

### 3.13 Certification

The following table lists the Q-Link VFD's certifications:

| Certifications | Agency <br> Approvals | UL, cUL |
| :--- | :--- | :--- |
|  | Enclosure <br> Rating | UL Type 1, Plenum-rated (UL508C), Available packaged as UL <br> Type 12/IP54, UL Type 3R/IP54, UL Type 4X/IP66 |
|  | Keypad <br> Rating | UL Type 1 (IP21) |
|  | Harmonic <br> Distortion | $R^{3}$ Filtering $\leq 35 \%$ at full load to address IEEE519 and EN50160 |

## CHAPTER 4 - INSTALLATION AND WIRING

Refer to the flowchart pictured below (Figure 4.1.1) for proper installation of the Q-Link VFD.

(Figure 4.1.1)

### 4.1 Installation and Precautions

Carefully review all installation warnings and instructions before proceeding.

- Handle VFD with care to prevent damage to the plastic components. Do not hold VFD by the front cover.
- Do not mount VFD on the equipment with excessive vibration above $5.9 \mathrm{~m} / \mathrm{sec}^{2}$.
- Install VFD in a location where temperature is within the permissible range $14 \sim 122^{\circ} \mathrm{F}$ (-10~50으).
- Install it on a non-combustible surface because VFD generates heat during normal operation.
- Mount VFD vertically (top up) for proper heat dissipation. Provide sufficient clearance for an airflow around VFD. (see figure 4.1.1 below)

(Figure 4.1.1)
- Do not mount VFD in direct sunlight or near other heat sources.
- The VFD should be mounted in a Pollution Degree 2 environment. If VFD is going to be installed in an environment with a high probability of dust, metallic particles, mists, corrosive gas or other contaminants, the VFD must be mounted inside the appropriate electrical enclosure with proper NEMA, UL or IP rating and adequate cooling. If VFD is mounted inside an enclosure, please consult factory for ambient temperature considerations.
- Mount VFD using proper screws or bolts.
- When two or more VFDs are installed in a ventilated enclosure, the cooling system should provide adequate airflow for all the VFDs. Do not install VFD above another heat source (another VFD, inductive reactors, etc.) Refer to figure 4.1.2.

(Figure 4.1.2)

### 4.2 Conduit Guidelines

- Follow the conduit guidelines as shown in the figure below. Refer to Figure 4.2.1.

(Figure 4.2.1)

### 4.3 Wiring Schematic - Standalone \& HP-Rated VFD's

### 4.4 Wiring Schematic - Smart Bypass

### 4.5 Wiring Schematic - VFD with Disconnect

1. DASHED LINES INDICATE FIELD WIRING.
2. REMOVE EMC JUMPER FOR CORNER GROUNDED DELTA SYSTEMS.

### 4.6 Power Wiring Recommendations

- The VFD provides the high-voltage and high-current connections for input power and output power. The input power is fused ( 3 phases) and filtered for EMC compliance.

|  | Name | Type | Description | Details |
| :---: | :---: | :---: | :---: | :---: |
| Input <br> Power <br> Terminals | R/L1 | Terminal | Phase A Voltage Input | Use only copper conductors rated for at least $60^{\circ} \mathrm{C}$ and 600 V . Tighten terminals to specified torques shown in torque table. |
|  | S/L2 | Terminal | Phase B Voltage Input |  |
|  | T/L3 | Terminal | Phase C Voltage Input |  |
|  | GND | Terminal | Ground |  |
| Motor <br> Output Terminals | U/T1 | Terminal | Phase A Motor Output |  |
|  | V/T2 | Terminal | Phase B Motor Output |  |
|  | W/T3 | Terminal | Phase C Motor Output |  |

- Do not connect input power to VFD Motor Terminals U/T1, V/T2, and W/T3 otherwise VFD can be damaged.
- Do not run input power and motor wires in the same conduit, otherwise the VFD can malfunction or be damaged. (See Figure 4.3.1)
- Do not run input power wires or motor leads for multiple VFDs in common conduit. (See Figure 4.3.1)
- Do not install power factor correction capacitors, surge suppressors, or RFI filters on the VFD output. These devices can trigger some VFD faults or even damage the VFD.
- Do not leave wire fragments, metal shavings or other metal objects inside the VFD, otherwise VFD can be damaged.
- Size power wire to maintain a voltage drop less than $2 \%$ at VFD or motor terminals.
- Install a load (output) reactor to protect motor windings if distance from 460V or 600V VFD to a motor is in the range 45-100 feet or output dV/dt filter for a range 100-1000 feet ( 800 feet for submersible pumps) or a sine wave filter for greater distances.

### 4.7 Grounding

- Ground VFD to the power source ground and motor ground to avoid electrical shock.
- Connect a dedicated ground wire from power transformer or power distribution panel to VFD ground terminal and dedicated ground wire from VFD to the motor for ground fault protection proper operation. If metal construction or conduits are used as ground leak current path, the VFD can have inadequate grounding and ground fault protection.
- Connect ground wire first before any other wires and only connect it to the dedicated ground terminal of the VFD. Do not use the case or the chassis assembly screws for grounding.
- VFD Grounding wire should be as short as possible.
- Do not install a ground rod at VFD package if it is not a service entrance rated panel, otherwise the VFD cannot provide proper ground fault protection or it can intermittently trip on Ground Fault.

### 4.8 Digital and Analog Control Circuit Terminal Layout

| Description | Name | Type | Description | Details |
| :---: | :---: | :---: | :---: | :---: |
| Damper Output | A+ | Terminal | 24VDC Damper out V+ (positive) | 24VDC Damper supply, 0.5A max |
|  | A- | Terminal | 24VDC Damper out V- (negative) |  |
| Analog In/Out | 24 | Terminal | 24VDC Control Power Output | 24 VDC supply capable of 50 mA maximum. <br> Analog PID reference or speed reference. <br> Max Error allowed is $1 \%$ of Full Scale |
|  | 1A | Terminal | Input (0-10V / 0-24V / 4-20mA) |  |
|  | 2A | Terminal | Configurable Input / Output 0-10V |  |
|  | SG | Terminal | Signal Ground |  |
| Dry Input <br> Terminals | D1 | Terminal | Dry Input 1 default: Run/N.O. | Shutdown / Permissive / Fireman's Override / Limit Switch / Speed A / Speed B / None - SW configurable Internal 24VDC 3mA circuit. |
|  | D2 | Terminal | Dry Input 2 default: None/N.O. |  |
|  | SG | Terminal | Signal ground/Shield |  |
| Communications | CG | Terminal | Communications Ground | RS-485 port for Modbus RTU and BACnet MS/TP Communications |
|  | - | Terminal | -RS-485 |  |
|  | + | Terminal | +RS-485 |  |
|  | SG | Terminal | Signal Ground/Shield | Wiring for communication to multiple drives |
|  | M- | Terminal | - RS-485 |  |
|  | M+ | Terminal | + RS-485 |  |
|  | E1 | CAT5 | Ethernet Port | Comm Port for Modbus IP and BACnet IP (Not pictured above - located below HOA buttons, on the left of the cooling fan cover) |

| Description | Name | Type | Description | Details |
| :---: | :---: | :---: | :---: | :---: |
| Relay Output Terminal | 01 | Terminal | Default Selection: Fault/N.O. | Fault, Run and Proof of Run relay - SW Configurable (1.25A @ 125VAC, Max Switching Voltage 250VAC) |
|  | 02 | Terminal | Default Selection: Fault/N.O. |  |
| Wet Input Terminals | V1 | Terminal 1 | Default Selection: Speed A/Active High (V) | Shutdown / Permissive / <br> Fireman's Override / Limit <br> Switch / Speed A / Speed B <br> / None - SW configurable <br> (Default N.O.) <br> 12-240VAC/VDC, 5mA maximum |
|  | V2 | Terminal 1 | Common 1 |  |
|  | V3 | Terminal 2 | Wet Input 2 default: External Trip/Active High (V) |  |
|  | V4 | Terminal 2 | Common 2 |  |
| Cooling Fan | Fan | Connector | Fan Power Supply | Cooling fan for VFD (factory wired) |
| Dry Input Terminals | D3 | Terminal | Dry Input 3 default: None | Shutdown / Permissive / Fireman's Override / Limit Switch / Speed A / Speed B / None - SW configurable (Default N.O.) 24VDC 3mA maximum |
|  | D4 | Terminal | Dry Input 4 default: None |  |
| Analog 1/0 | 3A | Terminal | Input (4-20mA) | Analog PID reference or speed reference. Max Error allowed is $1 \%$ of Full Scale |
|  | SG | Terminal | Signal Ground/Shield | Signal Ground is shared between terminals D3/D4 and 3A |
| Relay Output 2 | 03 | Terminal | Default Selection: Fault/N.C. | Fault, Run and Status relay - SW Configurable (1.25A @ 125VAC, Max Switching Voltage 250VAC) |
|  | 04 | Terminal | Default Selection: Fault/COM |  |
|  | 05 | Terminal | Default Selection: Fault/N.O. |  |

- Analog Input (1A, SG) - The Analog Input mode is user selectable (0-10V, 0-24V or 420 mA ) based on status of DIP switches.
- Configurable Analog Input/Output (2A, SG) - The Analog Input/Output mode is user selectable ( $0-10 \mathrm{~V}$ input, or output $0-10 \mathrm{~V}$ or $4-20 \mathrm{~mA}$ ) via DIP switches. When configured as an input it only accepts an 0-10VDC input signal. As an output, it provides a programmable/variable voltage or current.
- Analog Input 3A is a dedicated $4-20 \mathrm{~mA}$ input
- Wet Inputs (V1-V2, V3-V4) - Voltage Input accepts AC/DC voltages $12-240 \mathrm{~V} \pm 10 \%$, maximum current draw is 5 mA . Inputs can be interchanged between N.O. and N.C. Default state is Active High when voltage is present (N.O.).
- Dry Inputs (D1, D2, D3, D4 SG) - Four Dry inputs with maximum current limit of 3mA are available. Inputs can be interchanged between N.O. and N.C. Default contact state is NO.
- Power Outputs -
- (A+, A-) The Damper Power output will be activated as soon as an active run command from the VFD is initialized and provides 24 V DC at 0.5 A maximum. If a limit switch or a timer is used, the VFD will not output until the switch closes or timer expires.
(24, SG) The Control Power will output 24VDC at 50mA maximum. The Control Output will be activated whenever the VFD is powered up to provide controls to sensors

### 4.9 Signal Wiring

## Transducer Wiring

0-10VDC Transducer: Wire from the transducer's positive (Power) wire to the VFD terminal marked 24. Wire from the tranducer's output (Out) to VFD terminal marked 1A or 2A. Wire form the tranducer's common (Com) to the VFD terminal marked SG (Signal Ground). The shield wire should be connected to the ground lug on the VFD conduit plate.
$0-10 \mathrm{VDC}$ signal from Transducer

## BMS Control Wiring

0-10VDC BMS: Wire from the BMS Output (Out) to the VFD terminal marked 1A or 2A. Wire from the BMS Common (Com) to VFD terminal marked SG (Signal Ground). The shield wire should be connected to the ground lug on the VFD conduit plate.

0-10VDC signal from BMS

4-20mA Transducer: Wire from the transducer's positive (Power) wire to the VFD terminal marked 24. Wire from the tranducer's output (Out) to VFD terminal marked 1A or 3A. Wire form the tranducer's common (Com) to the VFD terminal marked SG (Signal Ground). The shield wire should be connected to the ground lug on the VFD conduit plate.
$4-20 \mathrm{~mA}$ signal from Transducer

4-20mA BMS: Wire from the BMS Output (Out) to the VFD terminal marked 1A or 3A. Wire from the BMS Common (Com) to VFD terminal marked SG (Signal Ground). The shield wire should be connected to the ground lug on the VFD conduit plate.

$$
4-20 \mathrm{~mA} \text { signal from BMS }
$$

### 4.10 Analog DIP Switch Configurations

The analog I/O configuration DIP switches 1 through 4 can be found to the right of the analog I/O terminals. DIP switches must be configured per the illustrations below to operate as desired.

1A - ANALOG INPUT
SWITCHES 3 \& 4

## 2A - ANALOG INPUT/OUTPUT SWITCHES 1 \& 2

### 4.11 Bypass Controller DIP Switch Configurations

The Bypass Controller (BPC) DIP switches can be found on the upper left of the unit BPC, present only in the Q-Link Smart Bypass packages. The default position for both switches is OFF. The BPC module functions can be enabled by moving the desired switch inward (right) toward the center of the module (see image below).

## Bypass Control Module Dipswitch Functions <br> Switch 1: Enable Bypass Manual Override <br> Switch 2: Enable Smart- <br>  Start ${ }^{\circledR}$ Feature set

### 5.1 Control Interface

1. On (Hand) [Hand Mode]: Commands the drive to run at a preset (user specified) frequency.
2. Off (Reset): During normal operating mode this button will stop the drive. During a fault condition, this button is used to reset and clear a fault when depressed for 3-5 seconds.
3. Auto [Automatic Mode]: This button is used to run the drive based on user defined remote commands, such as external sensors or BMS. When in "Auto Mode" the drive will only start or stop based on these user-configured remote commands.
4. Bluetooth Quick Response (QR) Code [Quick Connect]: Scanning QR code using the Q-Link mobile application allows for instant access to VFD.
5. Bluetooth Connection (Device Pairing Available): Indicates that the VFD is capable of supporting a Bluetooth connection.
6. Soft Keys: These keys correspond to the bottom left and right corners of the screen and will change according to current menu and function. On Bypass packages, the soft keys are used to switch between "VFD" and "Bypass" by selecting the desired mode (See section 5.4.1 for overview of the home screen).
7. Enter: Executes menu selection and to confirm any changes made to parameter settings. Also, allows user to access submenus and selected parameters.
8. Up and Down Arrows [Menu Select]: Use to navigate menus and adjust parameters.
9. Organic Light-Emitting Diode (OLED) Display: Displays status and menu items. The VFD defaults to the home screen and displays status indicators upon activation.

### 5.2 Control Interface

### 5.3 Basic Startup

During initial power-up, the VFD will show the message [Initializing VFD] and the HOA will be locked in the OFF position. At minimum, parameters BASIC-01 through BASIC-09 should be set prior to starting the VFD. To access the Basic Parameter group from the Home screen press 'Enter' to access 'Menus' and 'Enter' once more to select 'Basic Setup,' see below:

## Step 1: Select Application [Basic-01]

Select [BASIC] application if VFD is controlled by BMS, or select another application [Exhaust Fan, Supply Fan, Etc] if it is wired to a pressure transducer. Refer to the parameter table at the end of this quick-start for presets.

## Step 2: Enter Rated Motor Voltage [Basic-02]

Enter the rated voltage of the motor from the motor nameplate.

## Step 3: Enter Rated Motor HP [Basic-03]

Enter the motor horsepower rating from the motor nameplate.

## Step 4: Enter Rated Motor Current [Basic-04]

Enter the motor FLA (Full Load Amps) rating from the motor nameplate.

## Step 5: Enter Rated Motor RPM [Basic-05]

Enter the rated speed of the motor from the motor nameplate.

## Step 6: Set the High Frequency Limit [Basic-09]

Enter the high frequency limit that the drive will allow during operation.
Basic Parameters 10-22 should be verified and changed if necessary to ensure desired operation.

### 5.4 Main Menu Displays

5.4.1 Home Screen

The "HOME" screen displays horizontal rows, each containing information regarding the immediate status of the VFD.

|  | The home screen rows from top to bottom display: <br> - Motor Frequency <br> - Motor Current <br> - Output Voltage <br> - VFD status <br> - Run Source |
| :---: | :---: |
| SmartBypass Home Screen <br> When in Bypass Mode | On bypass packages, the right soft key is used to switch between VFD and Bypass mode. <br> When the bypass package is in VFD mode (normal operation), the right soft key will display "Bypass." To enter into bypass mode, press the bypass button. <br> Once in bypass mode the screen will indicate "BYP" in place of the drive speed, as it will now be operating across the line $(60 \mathrm{~Hz})$ when run command is received. <br> Status will also ready "BYP Stop" or "BYP Run" when in bypass mode. <br> To switch back into VFD mode, press the right soft key that indicates "VFD". |

5.4.2 Setpoint Screen

| Frequency |  | The "Setpoint" screen is used to change the motor "Motor Frequency Setpoint Value." Use the right soft key labeled "Select" to shift the cursor to the desired character. Use the up/down arrow keys to change the value. Select, "BACK" to exit this setting. |
| :---: | :---: | :---: |
| Frequency |  |  |
|  | OHz |  |
| $\mathrm{MiN}_{\substack{\text { M } \\ \text { OHz }}}$ | MaX |  |
| 00.0 17z |  |  |
| BACK | SELECT |  |

5.4.3 Quick Monitor Screen

The bottom row allows for back navigation to the home screen and entry to the submenus.

The indicators displayed on the Quick Monitor screen are defaults and cannot be changed. A separate "Configurable Quick Monitor" allows the user to select desired values to monitor (see section 5.4.4 below).

### 5.4.4 Configurable Quick Monitor Screen

The "Configurable Quick Monitor" screen displays four horizontal rows.

Configurable Quick Monitor Output Frequency
0.00 Hz

## Motor Speed

ORPM
Wattmetter
1kWh
BACK | MENUS

The first three rows display up to three user configurable values.

A user can modify what appears on the display screen by pressing "ENTER" and then using the arrow keys to move up or down and press "ENTER" again to select which of the three items they would like to change. Upon depressing "ENTER" another submenu will appear displaying three of the possible twenty-one display item options. Use the arrow keys to scroll through the submenu list of items and then depress the "ENTER" key to choose what you would like to display.

Available values are:

| Output <br> Frequency | Lined W <br> Current | D1-SG <br> Input |
| :---: | :---: | :---: |
| Motor Speed | DC Bus <br> Voltage | D2-SG <br> Input |
| Wattmeter | Output <br> Voltage | V1-V2 <br> Input |
| Average <br> Power | HOA <br> Mode | V3-V4 <br> Input |
| Average <br> Current | IGBT <br> Temp | 01-02 <br> Output |
| Line U <br> Current | Ambient <br> Temp | 1A Input |
| Line V <br> Current | Motor Run <br> Time | 2A Output |

## CHAPTER 6 - Q-LINK IOS \& ANDROID MOBILE APPLICATION

The Q-Link Companion App can be downloaded from either the Apple App Store ${ }^{\text {TM }}$ or the Google PlayStore ${ }^{\text {TM }}$.

### 6.1 Setup Bluetooth Connection

- From the Home screen, tap "Connect New Product."
- On the My Products screen, tap either "Scan QR Code Sticker" or "Enter an Access Code."
- A QR code targeting screen will appear upon tapping "Scan QR Code Sticker."
- Once the QR code is acquired and verified a new VFD item is added to the "Location" list on the home screen.

### 6.2 Setup VFD

- On the 'My Products' screen, tap "Q-Link <Name>" to connect to the device and enter the Dashboard
- Tap on drop-down "MENU" button located on the top-left of the display screen then press "Setup".
- Choose options under "Basic Setup" or "Advanced Setup" to change VFD settings.

CHAPTER 7 - PARAMETER LISTS

### 7.1 Primary Parameter Group

| Code | Modbus <br> Address | Full Parameter Name | OLED Display <br> Name | Parameter Setting Range |
| :--- | :--- | :--- | :--- | :--- | :--- |

### 8.2 Primary - Basic Setup Group

## PRIMARY PARAMETERS

PRIMARY-1: Application Selection

| Application | Default: Basic |
| :--- | :--- |
| 1) | 0 - Basic |
| BASIC | 1-Supply Fan |
|  | 2 - Exhaust Fan |
|  | $3-$ Cooling Tower |
|  | $4-$ Surface/Booster |
| Pump |  |
|  |  |

PRIMARY-1 Sets parameters based on a specific application. Starter mode provides very simple motor control at set speed or at preset speeds by digital inputs.

The first step in VFD setup is an application selection.
There are six application choices: Basic, Supply Fan, Exhaust Fan, Cooling Tower Fan, Centrifugal Pump and Starter.
The Basic selection provides a standard basic VFD control with start/stop command from keypad and mobile app interface.
The Supply or Exhaust Fan selection sets VFD for remote BMS (Building Management System) or PLC (Programmable Logic Controller) Start/Stop control and 4-20mA speed reference signal. All other related parameters such as Transducer range, Process Unit in WC, Direct or Inverse PID, etc. will be automatically set to the most common factory default values providing accurate motor control. In some cases, extra adjustment of some parameters is necessary to achieve better control. Stop mode is set to Coast mode to protect from any possible overvoltage trips while decelerating during stop mode.
The Cooling Tower Fan selection configures VFD for fan motor with internal inverse PID control and feedback from a temperature transducer. The process unit is set to ${ }^{\circ} \mathrm{F}$ with $0-$ $150^{\circ} \mathrm{F}$ temperature transducer range and $80^{\circ} \mathrm{F}$ PID set point. If MMC (Multi-Motor Control) feature is enabled with one of the auxiliary relays, the VFD can start a spray pump based on

VFD speed and system temperature. The inverse PID control increases fan motor speed if temperature is above set point.

The Surface/Pump selection provides constant pressure PID control with pressure transducer feedback. The process unit is set to PSI with 0100PSI transducer range and 50PSI set-point. The sleep mode is enabled and parameters are set to optimal values, which should be readjusted for better performance based on the system parameters and type of pump

| PRIMARY-2: Rated Motor Voltage |  |  |
| :--- | :--- | :---: |
| Motor Voltage <br> 2) | Min: 200 |  |
| Max: 480 |  |  |
| Default: 460 |  |  |

The motor voltage rating should be checked on the motor nameplate and set in PRIMARY-2 parameter. The VFD can produce output voltage equal to or less than input power voltage.

| PRIMARY-3: Rated Motor Horsepower |  |  |
| :--- | :--- | :---: |
| Motor Horsepower  <br> 3) 5HP | Min: 1 <br> Max: 200 <br> Default: 5 |  |

The HP rating from the motor nameplate should be put in this parameter. If VFD temperature rating needs to be increased up to $122^{\circ} \mathrm{F}$, derate this parameter by $20 \%$. The kW rating is for 230 V or 415V motor with FLA close to UL table for corresponding HP rating.

| PRIMARY-4: Rated Motor Current |  |
| :--- | :--- |
| Motor Current <br> 4) | Min: 0.5 <br> Max: 55.0 <br> Default: 0.5 |

The Motor Current will automatically detect and adjust according to DC bus voltage, Line Frequency and VFD size during initial power-up. The PRIMARY-4 parameter can be changed to the motor nameplate FLA if different from default.

PRIMARY-5: Rated Motor RPM

| Motor RPM <br> 5) <br> 1750RPM | Min: 500 <br> Max: 3600 <br> Default: 1750 |
| :--- | :--- |

Motor RPM can be changed to motor nameplate RPM if different from default. It is used for motor speed display proper scaling.

| PRIMARY-6: Power Line Frequency |  |
| :--- | :--- |
| Line Frequency <br> $6)$ 60 Hz | $0-50 \mathrm{~Hz}$ <br> $1-60 \mathrm{~Hz}$ <br> Default: 60 Hz |

Power Line Standard Frequency (for VFD and Bypass) - The Line Frequency parameter should be set to match the power line frequency 50 Hz or 60 Hz .

| PRIMARY-7: Maximum Frequency |  |  |
| :--- | :--- | :---: |
| Max Frequency  <br> 7$)$ Min: 30.00 <br>  Max: 240.00 <br> Default: 60.00  |  |  |

The PRIMARY-7 parameter should be set to the maximum output frequency that VFD can produce at full speed reference signal. For most standard industrial motors, it should be set to 50 Hz or 60 Hz .

Max Frequency determines the full range of the VFD speed control (VFD output frequency). The analog input range is scaled to VFD maximum frequency.

| PRIMARY-8: Base Frequency |  |  |
| :--- | :--- | :---: |
| Base Frequency  <br> 8) 60 Hz Min: 30.00 <br> Max: PRIMARY-7  <br> Default: 60.00  |  |  |

VFD provides full output voltage at this frequency. The PRIMARY-8 parameter should be set to the motor nameplate frequency rating. If Maximum Frequency is set to 70 Hz , Base to 60 Hz and Motor Voltage to 230 V , the VFD during acceleration will output 230 V at 60 Hz and from this point increase only frequency to 70 Hz .

| PRIMARY-9: High Frequency Limit |  |
| :--- | :--- |
| High Frequency Limit <br> 9) 60 Hz | Min: PRIMARY-10 <br> Max: PRIMARY-7 <br> Default: 60.00 |

If speed control signal exceeds "Frequency High Limit," then the VFD will run at Freq. High Limit Hz . (PID mode has separate frequency limit parameters).
The VFD has High and Low limit settings for the output frequency in both Remote and Local control modes. The PID control mode has separate output frequency limit settings. When VFD speed reference is set below Low Frequency limit or above High limit, the VFD output will stay at frequency limit.

| PRIMARY-10: Low Frequency Limit |  |  |
| :--- | :--- | :---: |
| Low Frequency Limit  <br> 10) Min: 5.00 Hz <br> 15 Hz  | Max: High Frequency <br> Default: 15.00 |  |

VFD output frequency low limit (No PID). Low Frequency Limit will be set to 15.00 Hz or 20.00 Hz based on PRIMARY-01 selected application. If speed control signal drops below Frequency Low Limit, VFD will run at Freq. Low Limit Hz. (PID mode has separate frequency limit parameters). Example of VFD actual reference with 100 Hz Max. Freq: 80 Hz High Limit and 30 Hz Low Limit.

| PRIMARY-11: Carrier Frequency |  |  |
| :--- | :---: | :---: |
| Carrier Frequency |  |  |
| 11)$\quad$Min: 2.0 <br>  |  |  |

The carrier frequency determines how many pulses the inverter transistors will create during one cycle. Some motors can create an audible noise, which can be eliminated by adjusting this carrier frequency during stop or run mode.

| PRIMARY-15: Power-On Run |
| :--- |
| Power-On Run <br> $15)$$\quad$0 - Disabled <br> $1-$ Enabled <br> Default: Enabled |

When set to (1) Enable, VFD will start at every power-up if run command is present.

| PRIMARY-16: Power-On Run Delay |  |  |
| :--- | :--- | :---: |
| Power-On Run Delay <br> 16) OH:00M:05S | Min: 0 <br> Max: 9999 s <br> Default: 5 s |  |

VFD will start after power up is done and delay time has expired (if run command is present).

| PRIMARY-17: Run After Fault Reset |  |  |
| :--- | :--- | :---: |
| Fault Reset \& Run | Default: Enabled |  |
| 17) | Enabled |  |
|  |  |  |
|  |  |  |
|  |  |  |

When set on Yes, VFD will start automatically after VFD fault is reset.

Restart after Fault Reset. If Enabled is selected, VFD will restart after fault reset (Manual, via DI or Comms) with start command present. If Disabled is selected, VFD will not restart after fault reset (Manual, via DI or Comms) with start command present. VFD will be in Stop mode until start command is removed and reapplied.

| PRIMARY-18: Torque Boost |  |  |
| :--- | :--- | :---: |
| Fault Reset Default: Enabled <br> $18) \quad$ Enabled - Disabled <br> 1 <br>   |  |  |

Torque Boost feature provides initial voltage (voltage offset of $\mathrm{V} / \mathrm{F}$ curve) at start for torque boost.

## PRIMARY-19: Torque Boost Level

| Fault Reset | Min: 0.00 |
| :--- | :--- |
| $19)$ | Enabled |
|  |  |
|  | Max: 15.00 |
| Default: 2.00 |  |

Torque boost value is set as \% of line voltage.

| PRIMARY-20: Start Mode |  |  |
| :--- | :--- | :---: |
| Start Mode 0- Accelerate <br> 20) Accelerate 1- DC Start <br> 2- Flying Start  <br>  Default: 2- Flying Start |  |  |

Three start modes: Accelerate- VFD ramps up based on V/F mode, DC-Start - DC brake applied before ramping up, Flying Start- Allows VFD to start with already rotating motor load without tripping on fault (Speed search function).

- When PID is disabled and start command is received, VFD will ramp up to frequency reference based on acceleration time setting.
- When PID is enabled and start command is received, VFD will ramp up to PID Low Limit Frequency based on acceleration time setting and then it will switch to PID mode with its own Accel time.

| PRIMARY-21: DC Start Level |  |  |
| :--- | :--- | :---: |
| DC Start Level | 0 - Low |  |
| 21) Low | 1 - Medium |  |
|  | $2-$ High |  |
|  | Default: Low |  |

DC Injection braking during start. Three levels: Low w/50\% Braking level and 8 sec timer; Medium at $60 \%$ \& 12 sec ; Heavy at $70 \%$ \& 16sec. Timing and level will be finalized during testing.

## PRIMARY-22: HOA Type

| HOA Type | 0 - Keypad HOA |
| :--- | :--- |
| 22) Keyboard HOA | 1 - Auto Only |
|  | 2 - Keypad Off/Auto |
|  | 3 - External HOA |
|  | Default: (0) Keypad HOA |

0 - VFD HOA: Fully functional HOA keypad.
1 - Auto Only- HOA is Disabled \& VFD is always in Auto mode, no changes by HOA keys.
2 - Hand Disabled- Fully functional Auto Mode and VFD can be stopped by HOA in OFF. No Hand Mode.
3 - If External HOA is selected, two digital inputs should be set to Hand and Auto and HOA switch should be wire to those inputs. (If both Dls are activated= Hand). Refer to Fig. 04 and Fig. 05 below.

## HOA Keypad and External HOA

DI Auto Digital input set to Auto
Auto Keypad HOA Auto output
Auto HOA Auto Mode output to control

PRIMARY-23: Run Command in Hand

| Hand Run Cmd | 0 - HOA in Hand |
| :--- | :--- |
| 23) Always Run | $1-$ Terminal |
|  | $2-3$-Wire |
|  | $3-$ Comms |
|  | Default: (0) HOA in |
|  | Hand |

Selections for Run Command in HOA Hand position. VFD starts when:
0 - HOA is in Hand;
1 - HOA= Hand and selected terminal is activated;
2 - HOA=Hand \& Start Button is pressed,
$6-$ HOA $=$ Hand \& start command is given via comms.

| PRIMARY-24: Speed Reference in Hand |  |  |
| :--- | :--- | :---: |
| Hand Speed Ref | 0 - Keypad |  |
| 24) | Keypad |  |
|  |  |  |
|  | 1-1A Analog Input |  |
|  | 2- 2A Analog Input |  |
|  | 3- Communications |  |
|  | 4-3A Analog Input |  |
|  | Default: (0) Keypad |  |

Selections for Speed Reference in HOA Hand position.

When HOA is in Hand position, PID mode is disabled. 2A is available when 2A DIP Switch is set to Input.

| PRIMARY-27: Keypad Frequency |  |  |
| :--- | :--- | :---: |
| Keypad Frequency | Min: PRIMARY-10 (Low |  |
| 27) 15 Hz | Frequency) |  |
|  | Max: PRIMARY-9 (High |  |
|  | Frequency) |  |
|  | Default: 15 Hz |  |

Freq reference via keypad in Hand or Auto Mode.

| PRIMARY-30: Stop Mode |  |  |
| :--- | :--- | :---: |
| Stop Mode <br> 30) | Coast |  |
|  | Default: Decelerate <br> 0 - Decel <br> $1-$ Coast |  |

When stop command is received, VFD will stop based on selection: DECEL - Decrease output frequency to OHz per Deceleration Time setting, COAST - immediately stop switch and motor will coast to a stop

PRIMARY-31: DC Brake Frequency

| Stop Mode <br> $30)$ | Default: Decelerate <br> $0-$ Decel <br> $1-$ Coast |
| :--- | :--- |

PRIMARY-34: Acceleration Time

| Accel Time |  |
| :--- | :--- |
| 34) | Mo.0s |
|  |  |
|  | Min: 1.0 s <br> Max: 6000.0s <br> Default: 30.0s |

Time it takes to accelerate from 0.00 Hz to Max Frequency.

| PRIMARY-35: Deceleration Time |  |  |
| :--- | :---: | :---: |
| Decel Time |  |  |
| 35) Min: 1.0 s <br>  30.0 s |  |  |

The time it takes to decelerate from Max Frequency to 0.00 Hz .

| PRIMARY-36: V/F Mode |  |  |
| :--- | :--- | :---: |
| V/F Mode Linear | - Linear <br> $1-$ Squared <br> 36) |  |
|  | Default: (0) Linear |  |

Linear pattern maintains a linear $\mathrm{V} / \mathrm{Hz}$ ratio. Squared pattern maintains a squared $\mathrm{V} / \mathrm{Hz}$ pattern, ideal for fan/pump applications.

## Linear

Provides linear change of output Voltage corresponding to output frequency change. Linear pattern maintains a linear $\mathrm{V} / \mathrm{Hz}$ ratio.

## Squared

Provides squared change of output Voltage corresponding to output frequency change. This
cure provides more energy efficient control for variable torque applications such as: Fans, Blowers and Pumps.

PRIMARY-41: Run Command in Auto

| Auto Run Cmd | 0 - HOA in Auto |
| :--- | :--- |
| 41 ) | Terminal |
|  | $1-$ Terminal |
|  | $2-3-$ Wire |
|  | $3-$ Comms |
|  |  |
|  |  |
|  |  |
|  |  |

Selections for Run Command in HOA Auto position based on selection. VFD starts when:

0 - HOA is in Auto;
1 - HOA= Auto and selected terminal is activated;
2 - HOA=Auto \& Start Button is pressed,
3 - HOA= Auto \& start command is given via Comms.

PRIMARY-42: Speed Reference in Auto
Auto Speed Ref

> | 0-Keypad |
| :--- |
| 1-1A Analog Input |
| $2-2 A$ Analog Input |
| 3- Comms |
| 4- PID |
| 5-3A Analog Inputs |
| Default: (0) Keypad |

Selection for speed reference source in Auto mode. 1A input 0-10VDC or 4-20mA type will be set by 1A DIP switch. 2A input is always $0-10 \mathrm{~V}$. 2A selection is available when 2A DIP Sw is set to Input. When set to PID, all PID parameters will be available.

## Keypad

When VFD HOA Auto key is pressed or external HOA SW is put in Auto position, VFD will provide output frequency corresponding to a reference given via VFD keypad.

## 1A Input

Provides frequency reference via 1A Input set by DIP Sw to $4-20 \mathrm{~mA}$ or $0-10 \mathrm{VDC}$ (scalable in I/O group). If DIP Sw is in 24 V position, processor still treats it as 0-10VDC because it will be scaled to that level by hardware components.

## 2A Input

Provides frequency reference via 2A Input set by DIP Sw to 0-10VDC input (scalable in I/O group).

## 3A Input

Provides frequency reference via 3A Input set by.

## Communications

When Communication is selected as a speed reference source, VFD will provide output frequency based on reference set by communications.

## PID

VFD speed reference will be provided by PID control based on difference between PID Setpoint and Feedback values. When set to PID, all PID parameters will be available. When PID mode is enabled, DC trip prevention, stall prevention and skip frequencies are disabled.

PRIMARY-43: Reference Loss Condition

| Anlg Ref Loss 43) Half of Min | 0 - Disabled <br> 1 - Below $1 / 2$ of Min <br> 2 - Below Min <br> Default: (1) Half of Min |
| :---: | :---: |

Select either below minimum value, or below half of minimum value of the analog signal selected as a speed reference loss condition.

| PRIMARY-44: Reference Loss Action |  |  |
| :--- | :--- | :--- |
| Anlg Ref Loss Act | 0 - Fault |  |
| $44)$ | Stop | 1 - Stop |
|  |  | - Hold Speed |
|  | Default: (1) Stop |  |

Select a VFD action at signal loss:

0- Fault= VFD trips and manual reset or rebooting is required;
1- Stop = VFD stops using the stop mode defined in BASIC 30; Provides auto restart when signal value is equal or greater than Reference Min value, and run command is present.
2- Hold = VFD runs at previous speed.

| PRIMARY-45: Reference Loss Delay |  |  |
| :--- | :--- | :---: |
| Anlg Ref Loss | Min: 0s |  |
| 45) Delay 1s | Max: 20s |  |
| Default: 1s |  |  |

Low reading on sensor could be normal condition for some period of time. Delay should be set to prevent drive from tripping under normal condition.

| PRIMARY-49: PID Feedback Unit |  |  |
| :--- | :--- | :---: |
| PID Feedback Unit | $0-\mathrm{PSI}$ |  |
| 49) | $1-\mathrm{GPM}$ |  |
|  | $2-\mathrm{inWC}$ |  |
|  | $3-\mathrm{CFM}$ |  |
|  | $4-\mathrm{inHg}$ |  |
|  | $5-\mathrm{Feet}$ |  |
|  | $6-{ }^{\circ} \mathrm{F}$ |  |
|  | $7-\mathrm{mBar}$ |  |
|  | $8-\mathrm{Pa}$ |  |
|  | $9-\mathrm{kPa}$ |  |
|  | $10-\mathrm{Meters}$ |  |
|  | $11-{ }^{\circ} \mathrm{C}$ |  |
|  | $12-\mathrm{Custom}$ |  |
|  | $13-\%$ |  |
|  | Default: (0) PSI |  |
|  |  |  |

Unit selection for feedback signal.

| PRIMARY-50: PID Feedback Max |  |
| :--- | :--- |
| PID Feedback Max | Min: 0.0 |
| 53) | Max: 6000.00 |
|  | Default: 100.0 PSI |

Sensor (Transducer) maximum rating. For 0250PSi transducer set it to 250.0PSI. * Number of decimals depends on selected Unit.

| PRIMARY-52: PID Set-Point Value |  |
| :--- | :--- |
| PID Set-point Value | Min: 0.0 |
| $52)$ | Max: [Primary-50] x 0.95 |
|  | Default: Determined by |
|  | Primary-1 |

PID Set-point (Desired pressure, temperature, GPM, etc.) Maximum value is $5 \%$ less than Sensor range for proper PID operation.

| PRIMARY-55: PID P-Gain |  |  |
| :--- | :--- | :---: |
| PID P-Gain | Min: 0\% |  |
| 55) 10\% | Max: $999 \%$ <br> Default: $10 \%$ |  |

P-Gain determines PID control sensitivity. Greater value provides more sensitivity.

| PRIMARY-56: PID I-Gain |  |  |
| :--- | :--- | :---: |
| l-Gain <br> $56)$$\quad 1.0 \mathrm{~s}$ | Min: 0.1 s <br> Max: 32.0 s <br> Default: 1.0 s |  |

I-time determines PID response time. Greater value provides slower response.

| PRIMARY-57: Out Ramp Time |  |  |
| :--- | :--- | :---: |
| PID Ramp Time | Min: 0.0 |  |
| 57) | Max: 10.0 |  |
|  | Default: 0.0 s |  |

Sets PID output ramp-up. Ramp-down time will be set to $150 \%$ of PRIMARY-57. Extra ramp time in addition to calculated PID value.

| PRIMARY-58: PID High Frequency Limit |  |
| :--- | :---: |
| PID High Freq |  |
| 58$)$ Min: Prime-59 <br>  Max: Prime-07 <br> Default: 60 Hz  |  |

PID frequency output will be limited by Primary58 value.

| PRIMARY-59: PID Low Frequency Limit |  |
| :--- | :--- |
| PID Low Freq | Min: 0.0 |
| 59) | Max: Prime-58 |
|  | Default: 20 Hz |

PID frequency output will be limited by Primary59 value.

| PRIMARY-60: Feedback Signal Loss |  |  |
| :--- | :--- | :---: |
| Fdbk Loss | 0 - Disabled |  |
| 60) Below $1 / 2$ Min | 1 - Below $1 / 2$ of Min. |  |
|  | 2 - Below Min. |  |
|  | Default: Below $1 / 2$ Min |  |

Signal loss condition either Half of Analog Signal minimum value or below minimum value.

| PRIMARY-61: Feedback Loss Action |  |  |
| :--- | :--- | :---: |
| Feedback Loss Action | 0 - Fault |  |
| 61) Stop | 1 - Stop |  |
|  | 2 - Hold Speed |  |
|  | Default: (1) Stop |  |

Select a VFD action at signal loss:

0-Faults = VFD fault trips and Manual reset or rebooting is required;
1- Stop = VFD stops using the stop mode defined in BASIC 30;
2-Hold= VFD runs at previous speed.
1 and 2 selections provide auto restart when F/B signal is restored and its value is equal or greater than F/B Min value and run command is present.

| Fdbk Loss Delay <br> 62) | Min: 0s <br> 1s |
| :--- | :--- |
|  | Max: 10s <br> Default: 1s |

Default: 1s

Low reading on a sensor could be normal condition for some period of time. The delay should be set to prevent the drive from tripping under normal conditions.

### 8.3 VFD - Advanced Setup Group

| VFD-4: Auto Bypass |  |  |
| :--- | :--- | :---: |
| Auto Bypass | - Disabled |  |
| 4) Disabled | 1- On VFD Fault |  |
|  | 2 - Bypass Comm Loss |  |
|  | 3-VFD Fault \& Bypass |  |
|  | Comm Loss |  |
|  | Default: Disabled |  |

If set to "On VFD Fault" and VFD trips, the VFD bypass will start if run command is present. If set to "Bypass Comm Loss" and VFD communication is not present, the bypass will start. If set to both, bypass starts when either VFD-Bypass comms are lost or VFD is in Fault mode.

| VFD-6: Damper Control |  |  |
| :--- | :--- | :---: |
| Damper Control <br> 6)$\quad$Disabled | Disabled <br> Default: (0) Disabled |  |

Enables Damper or Lubrication Mode. If start command is received, VFD will provide 24VDC, 0.5 A to a damper motor and after Damper delay or when DSW is closed VFD will start motor.

| VFD-7: Damper Delay |  |  |
| :--- | :--- | :---: |
| Damper Delay <br> 7) 120s | Min: 0s <br> Max: 6000s <br> Default: 120s |  |

1. No damper limit switch. After start command is received, VFD will provide power to a damper motor and after Damper delay it will start the motor. There is no damper fault by limit switch.
2. If a digital input is set to damper SW and VFD receives run command, VFD provides power to damper motor and after limit SW is closed, it will start a motor. If SW is not closed within time delay, VFD will trip on damper fault.

## Skip Frequencies

There are three sets of Skip Frequency pairs of parameters that let you Enable or Disable or set Low and High value for each set. The description below applies to each set respectively:

- Disabled: Skip frequency is disabled
- Enabled: Skip frequency allows you to skip from the VFD reference short frequency range of system resonant frequencies.

Skip Frequency

If the speed reference given digitally from a keypad or communication is set to a value in the skip zone, the VFD will run at Low Skip Hz until the speed command is at or above High Skip Hz . Then the VFD speed reference will jump from Low to High Skip Hz and the VFD output frequency will ramped up based on the acceleration time. On each skip zone, the only condition we need to maintain is that the Skip High should be at least 1 Hz greater than Skip Low. Between zones it is not a problem if the $2^{\text {nd }}$ Skip Zone is set below or overlapping the $1^{\text {st }}$ one.

- Low Frequency (Low frequency of the resonance skip zone): If analog signal or communication is used for speed reference, the VFD will continue to run at the Low Skip Frequency until the signal value is at or greater than the High Skip Frequency. Then the VFD will ramp-up from Low to High skip Hz based on the acceleration time. Range OHz to PRIMARY-7 (Max Frequency).
- High Frequency (High frequency of the resonance skip zone): Range - Low Frequency for this Skip Frequency to PRIMARY-7 (Max Frequency).

| VFD-10 Skip Freq 1 Enable |  |
| :--- | :--- |
| Skip Freq 1 Enable | 0 - Disabled |
| 10) | Disabled |
|  | $1-$ Enabled <br> Default: Disabled |

Skip frequency 1 enable/disable. Used to bypass mechanical system resonance frequencies.

| VFD-11 Skip Freq 1 Low |  |
| :--- | :--- |
| Skip Freq 1 Low <br> 11) | Min: 0 <br> Max: PRIMARY-7 <br> Default: 23Hz |

Skip frequency 1, Lower Value will appear when Skip Frequency 1 is set to Enable

| 12) 26 Hz | Max: PRIMARY-7 <br> Default: 26 Hz |

Skip frequency 1, Upper Value will appear when Skip Frequency 1 is set to Enable

| VFD-13 Skip Freq 2 Enable |  |
| :--- | :--- |
| Skip Freq 2 Enable <br> 13) | 0 - Disabled <br> $1-$ Enabled <br> Default: Disabled |

Skip frequency 2 enable/disable. Used to bypass mechanical system resonance frequencies.

| VFD-14 Skip Freq 2 Low |  |
| :--- | :--- |
| Skip Freq 2 Low <br> 14) | Min: 0 <br> Max: PRIMARY-7 <br> Default: 33Hz |

Skip frequency 2, Lower limit will appear when Skip Frequency 2 is set to Enable

| VFD-15 Skip Freq 2 High |  |  |
| :--- | :--- | :---: |
| Skip Freq 2 High  <br> 15) 36 Hz | Min: VFD-14 <br> Max: PRIMARY-7 <br> Default: 36Hz |  |

Skip frequency 2, Upper limit will appear when Skip Frequency 2 is set to Enable

| Skip Freq 3 Enable | 0 - Disabled |  |
| :--- | :--- | :--- |
| 16) | Disabled | $1-$ Enabled <br> Default: Disabled |

Skip frequency 3 enable/disable. Used to bypass mechanical system resonance frequencies.

| VFD-17 Skip Freq 3 Low |  |  |
| :--- | :--- | :---: |
| Skip Freq 3 Low <br> 17) | Min: 0 <br> Max: PRIMARY-7 <br> Default: 43Hz |  |

Skip frequency 3, Lower limit will appear when Skip Frequency 3 is set to Enable

| VFD-18 Skip Freq 3 High |  |  |
| :--- | :--- | :---: |
| Skip Freq 3 High <br> 18) | Min: VFD-17 <br> Max: PRIMARY-7 <br> Default: 46Hz |  |

Skip frequency 3, Upper limit will appear when Skip Frequency 3 is set to Enable.

## Frequency Speed Setup

There are three configurable speed parameters that allow you to set the VFD frequency to preset values, as described below:

- Speed A: The VFD will switch its frequency reference to preset frequency-A in Auto mode without PID control, or Hand mode when DI is set with Speed-A activated. If in Auto mode PID control is enabled and DI set with Speed-A activated, nothing will be changed in VFD operation. Fireman's override mode overrides preset speeds.
- Speed B: Same as above but DI is set to Speed-B.
- Speed AB: If one DI is set to Speed-A and another one to Speed-B and both are activated simultaneously, the VFD will run at the frequency set in ADVVFD-21. VFD operation is identical to ADVVFD-19.

VFD-19 Speed A
Speed A
19)

30 Hz
Min: PRIMARY-10
Max: PRIMARY-7 Default: 30.00 Hz

Preset frequency-A by digital input for Auto mode

## VFD-20 Speed B

| Speed B |
| :--- | :--- |
| $20)$ |$\quad 35 \mathrm{~Hz}$| Min: PRIMARY-10 |
| :--- |

2A Analog Output (0-10V or 4-20mA set by DIP Switch) parameter selection. Analog output is scaled to Max value of the selected parameter. Example: DC Link Voltage is 01000VDC.

## I/O-68: 3A Input Filtering Level

| 3A Input Filter |  | 0 - Fault |
| :---: | :---: | :---: |
| 68) | Fault | 1 - Run |
|  |  | 2 - Proof of Run |
|  |  | Default: (0) Fa |

2A Analog output scaling. For max Frequency 60 Hz at $50 \%$ setting, 2 A output will provide 5VDC or 12 mA (depending on 2A DIP Sw position).

### 8.5 Protection

## PROT-1: Preheat Mode

Preheat Mode
1)

## 0 - Disabled

1 - Low Heat
2 - Medium Heat
3 - High Heat Default: Disabled

0 - Pre-Heat Disabled;
1 - Low current level with low duty cycle for cool temperatures. VFD provides low level preheat current with low duty cycle. It should be enough to keep motor winding warm during cool summer nights;
2 - Medium current level with medium duty cycle for cold temperatures. VFD provides medium level pre-heat current with medium duty cycle. It should be enough to keep motor winding warm during cool days and cold nights in autumn or spring;
3 - High current level with High duty cycle for freezing temperatures. VFD provides high level pre-heat current with high duty cycle. It should be enough to keep motor winding warm during cold days and freezing nights in winter.

PROT-3: No Motor Fault

| No Motor Fault <br> $3)$$\quad$ Enabled | 0 - Disable <br> 1 - Enable <br> Default: Enabled |
| :--- | :--- |

All three phases have current below 15\% of FLA for 250 ms

| PROT-4: Stall Prevention |  |  |
| :--- | :--- | :---: |
| Stall Prevention 0 - Disable <br> 4) Enabled <br>   <br>  1 - Enable <br> Default: Enabled  |  |  |

This works as a current limiting function protecting motor from excessive current above the stall level setting by decreasing the motor speed until the current is reduced to the stall level or speed is reduced to the minimum speed.

## PROT-5: Stall Level

| Stall Level |  |
| :--- | :--- |
| 5) 150\% | Min: $30 \%$ |
|  | Max: $200 \%$ |
|  | Default: $150 \%$ |

Stall level is set as a percentage of the motor FLA.

PROT-6: DC Trip Prevention

## DC Trip Prevention

6) Enabled

0 - Disabled
1 - Enabled Default: Enabled

Enables prevention of DC Trip.

| PROT-7: Overload Continuous |  |
| :---: | :---: |
| Ovid Continuous | Min: 50\% |
| 7) 100\% | Max: 135\% Default: 100\% |

EOL continuous level (SFA if motor can run at SF $24 / 7$ ) EOL is always enabled to protect motor.

Overload Continuous is a percentage of PRIMARY-04 Motor FLA for continuous run without E-Thermal trip. It can be set to motor SFA (service factor amps) if motor is designed to operate at service factor amps continuously like submersible pump motors. For most of the standard induction motors this value should be kept at 100\% (default).

PROT-8: Overload Trip Class

| Ovid Trip Class | Min: $1 \%$ |  |
| :--- | :--- | :--- |
| 8) | Max: $50 \%$ |  |
|  |  | 0 - Class 5 |
|  |  | - Class 6 (Pump) |
|  |  | 2 - Class 10 |
|  |  | - Class 20 |
|  |  | Default: 10\% |

Motor overload industry standard class curve selections. (ONLY for VFD)

| PROT-9: Bypass MOL Class |
| :--- |
| Bypass MOL Class |
| 9) |

Motor overload industry standard class curve selections. (ONLY for VFD)

PROT-12: Overcurrent Level

| Overcurrent Level |  |
| :--- | :--- |
| 12) $200 \%$ | Min: 70\% |
|  | Max: 200\% |
| Default: 200\% |  |

\% of motor FLA. If any phase current is greater than setting for MOC delay, VFD trips.

This level as a percentage of Motor FLA determines a fault trigger point. If motor current exceeds this level for PROT-13 Delay time, the VFD trips on Motor Overcurrent (MOC). This is a safeguard from running the motor with windings or motor leads electrical failure.

| PROT-13: Overcurrent Delay |  |  |
| :--- | :--- | :---: |
| Overcurrent <br> Delay <br> 13)$\quad$Min: 0.1s | Max: 5.0 s <br> Default: 0.1 s |  |

Delay before Motor Overcurrent Fault occurs.

Sets the delay time for the Motor Overload trip. Timer starts when the current exceeds PROT-12 level. Timer will be reset if counting during Motor Overload Current Condition and the current drops below the Motor Overload Current Level.

| PROT-38: Critical Fault Retries |  |  |
| :--- | :--- | :---: |
| Crit Fault Retries <br> 38) 3 | Min: 0 <br> Max: 10 <br> Default: 3 |  |

Sets number of retry attempts. $0=$ disabled.

| Crit Fault Retry Delay <br> 39) | Min: 0s <br> Max: 6000s <br> 180s |
| :--- | :--- |
| Default: 180s |  |

Sets time delay before retry attempts. Available when PRIMARY-18 is greater than 0

| PROT-40: Normal Fault Retries |  |  |
| :--- | :--- | :---: |
| Nrml Fault Retries <br> 40) | Min: 0 <br>  |  |
|  | Max: 10 <br> Default: 3 |  |

Sets number of retry attempts. $0=$ disabled.

| PROT-41: Normal Fault Retry Delay |  |  |
| :--- | :--- | :---: |
| Nrml Fault Retry Delay | Min: 0s |  |
| 41) | 120s |  |
|  | Max: 6000s <br> Default: 120s |  |

Sets time delay before retry attempts. Available when PRIMARY-18 is greater than 0.

### 8.6 Communication

| COMMS-1: Communication Protocol Selection |  |  |
| :--- | :--- | :---: |
| Protocol  <br> 1) ModBus RTU - Modbus RTU <br> $2-$ BACnet MS/TP <br>  <br>  $\mathbf{l}$ |  |  |

## Comms Protocol Selection.

COMMS-3: Communications Write Access

| Write Access <br> 3) Disabled | 0 - Disabled <br> $1-$ Enabled <br> Default: Disabled |
| :--- | :--- |

Enable Comms Writes (other than Control) COMMS-1-0,1,2,3

## COMMS-4: Comms Loss Fault

| Comm Loss Fault | 0 - Fault |
| :--- | :--- |
| 4) | Disabled |
|  |  |
|  |  |
|  | stop mode) |
|  | 2 - Hold Speed |
|  | Default: Disabled |

Operating mode when communications signal is lost if Control or Reference is set to Comms;
COMMS-1-0,1,2,3

## COMMS-5: Timeout

| Comm Loss Delay | Min: 0s |
| :--- | :--- |
| 5) | 1.0s |
|  | Max: 120.0 s <br> Default: 1.0 s |

Time it takes to determine the loss of communication signal: COMMS-1-0,1,2,3

## COMMS-6: RS-485 Baudrate

| RS485 Baud | $0-9600$ |
| :--- | :--- |
| 6) | 19200 |
|  | $1-19200$ |
|  | $2-38400$ |
|  | $3-57600$ |
|  | $4-76800$ |
|  | $5-115200$ |
|  |  |
|  | Default: 19200 |

Baud Rate
COMMS-1-0,2

## COMMS-7: RS-485 Parity Stop

| Modbus RTU | 0 - None, 2 Stop |
| :--- | :--- |
| 7) None | 1 - Even, 1 Stop |
|  | 2 - Odd, 1 Stop |
|  | $3-$ None, 1 Stop |
|  |  |
|  | Default: None |
|  |  |

Parity/Stop bits selection

COMMS-1-0,2
COMMS-9: ModBus RTU Address

| ModBus RTU Addr <br> 9) | Min: 1 <br> 247 |
| :--- | :--- |
|  | Max: 247 |
|  | Default: 247 |

## Modbus Device Address

COMMS-1-0,2

| COMMS-10: BACnet MAC/ID |  |
| :--- | :--- |
| BACNET MS/TP Node | Min: 0 |
| 10) | 1 |
|  | Max: 127 |
|  | Default: 1 |

BACnet MAC/ID
COMMS-1-2,3

| COMMS-11: BACnet MS TP Max Master |  |  |
| :--- | :--- | :--- |
| BACNET MS TP Max Mstr | Min: 0 |  |
| 11) | Max: 127 |  |
|  |  | Default: 127 |

BACnet Max Master
COMMS-1-2,3

| COMMS-12: BACnet Device Instance |  |  |
| :--- | :--- | :---: |
| BACNET Instance | Min: 0 |  |
| 12) 223000 | Max: 4194303 |  |
|  | Default: 223000 |  |

BACnet Device Instance (0-4194303, default 2230000) COMMS-1-2,3

## Comms-27-30

These parameters are only accessible through remote communications (Modbus/BACnet) and are used to control VFD operation. Comms Run/stop, Comms Command Frequency, and Comms PID Setpoint must be enabled from their associated settings before being used (Primary24, Primary-23, Primary-41, Primary-42, Primary47).

| COMMS-27: Comms Run/Stop |  |  |
| :--- | :--- | :--- |
| Run/Stop <br> 27) | Stop | - Rup <br> Default: Stop |

COMMS-28: Comms Commend Frequency

| N/A <br> 28) | 15 Hz |
| :--- | :--- | | Min: Low Freq Limit |
| :--- |
| Max: High Freq Limit |
| Default: 15.00 Hz |

| COMMS-29: Comms PID Setpoint |  |
| :--- | :--- |
| N/A | Min: 0 |
| 29$)$ | 60 PSI |
|  | Max: $[$ Prime-50] *0.95 <br> Default: $60[$ PSI] |

| COMMS-30: Comms Reset Fault |  |  |
| :--- | :--- | :---: |
| N/A | 0 - None |  |
| $30)$ | None |  |
|  | $1-$ Reset |  |
|  | Default: None |  |

COMMS-36: Bluetooth Enable

| Bluetooth Enable <br> $36)$ | 0 - Disable <br> $1-$ Enable <br> Default: Enab |  |
| :--- | :--- | :--- |
|  |  | Enable |
|  |  |  |

Enable or disable the Bluetooth module. When disabled, device does not broadcast its presence.

### 8.7 View Information

| VIEW-1: VFD Output Frequency |  |
| :--- | :--- |
| Output Frequency <br> 1) | Min: 0.0 <br> Max: $240.00[\mathrm{~Hz}]$ |

Displays the VFD output frequency.

| VIEW-2: Motor Speed |  |
| :--- | :--- |
| Motor Speed <br> 2) | Min: 0.0 <br> Max: $3600[R P M]$ |

Displays the current RPM of the motor.

| VIEW-3: Wattmeter |  |
| :--- | :--- |
| Wattmeter <br> 3) | Min: 0.0 |
| Max: $4294967[\mathrm{kWh}]$ |  |

Displays the current Wattage measurement.

## VIEW-5: Average Output Current

Average Current
5)
Min: 0.0
Max: 6x VFD FLA [A]

Displays the Average Output Current.

| VIEW-6: Line U Current |  |
| :--- | :--- |
| Line U Current <br> $6)$ | Min: 0.0 <br> Max: 6x VFD FLA [A] |

Displays the Line U Current.

VIEW-7: Line V Current

| Line V Current |  |
| :--- | :--- |
| $7)$ | Min: 0.0 |
| Max: $6 x$ VFD FLA [A] |  |

Displays the line V Current.

| VIEW-8: Line W Current |  |
| :--- | :--- |
| Line W Current <br> 8) | Min: 0.0 <br> Max: $6 \times$ VFD FLA $[A]$ |

Displays the Line W Current.

| VIEW-9: DC Bus Voltage |  |
| :--- | :--- |
| DC Bus Voltage <br> 9) | Min: 0.0 |
|  | Max: 1000.0 |

Displays the DC bus voltage.

| VIEW-10: Output Voltage |  |
| :--- | :--- |
| Output Voltage <br> 10) | Min: 0.0 <br> Max: 600.0 |

Displays the VFD calculated output voltage (RMS).

| VIEW-11: Output Status |  |
| :--- | :--- |
| Output Status | 0 - VFD Off |
| 11) | 1 - Accelerate |
|  | 2 - Decelerate |
|  | 3 - Steady |
|  | 4 - Speed search |
|  | 5 - Flying start |
|  | 6 - DC output |
|  | 7 - Preheat |
|  | 8 - DC trip prevention |
|  | 9 - Stall prevention |
|  | 10 - Bypass off |
|  | 11 - Bypass run |

Displays the output status.

| VIEW-12: System Status |  |
| :--- | :--- |
| System Status | $0-$ VFD stop |
| 11) | $1-$ VFD run |
|  | $2-$ VFD disabled |
|  | $3-$ VFD fault |
|  | $4-$ VFD shutdown |
|  | $5-$ VFD fireman's |
|  | override |
|  | $6-$ VFD auto reset |
|  | $8-$ Power-on delay |
|  | $12-$ Signal loss |
|  | $14-$ PID run |
|  | $15-$ Open damper |
|  | $18-$ Bypass stop |
|  | $19-$ Bypass manual |
|  | $20-$ Bypass override |
|  | $22-$ Bypass auto on |
|  | fault |
|  | $23-$ Bypass disabled |
|  | $24-$ Bypass fault |
|  | $25-$ Bypass shutdown |
|  | $27-$ Bypass auto on |
|  | comms loss |
|  |  |

Displays the current system operating status.

| VIEW-13: Fault |  |
| :---: | :---: |
| HOA Mode | 0 - None |
| 13) | 1 - Motor Overload (C) |
|  | 2 - Motor Over Current |
|  | 3 - VFD Over Current (C) |

|  | 47 - Control Board Error |
|  |  |
|  | 48 - VFD Cooling Fan (L) |
|  | 49 - Power Board |
|  | Communications Error |
|  |  |
|  | 50 - Overpressure (A) |
|  | (P) |
|  | 51-BMS |
|  | Communications Loss |
|  | (A) |
|  | 52 - Analog Signal Loss |

|  | $53-$ Transducer Signal |
| :--- | :--- |
|  | Loss (A) |
|  | $54-$ EEPROM Error |
|  | $55-$ Calibration CRC |
|  | Failed |
|  | $56-$ Bluetooth Key CRC |
|  | Failed |
|  | $57-$ Invalid Firmware |

Displays the fault type.
(C)- Critical type faults require long retry delay (L)- Light type faults allow short retry delay
(M)- Faults require manual reset
(A)- Faults with Auto Reset/Restart abilities

At the end of Protection group there are separate retry parameters for (C) Critical and (L) Light faults.

| VIEW-15: PID Feedback Value |  |  |
| :--- | :--- | :---: |
| PID Feedback Value <br> 15) | Min: 0 <br> Max: 3000 |  |

Displays the current PID feedback value in selected units. (PSI, GPM, etc.)

| VIEW-16: $2^{\text {nd }}$ Input Value (Units) |  |
| :--- | :--- |
| $2^{\text {nd }}$ <br> $16)$ | Min: 0 |
| Max: 3000 |  |

Analog input in selected units (decimals depend on selected unit)

| VIEW-17: Inverter Temperature |  |
| :--- | :--- |
| IGBT Temp Min: 0.0 <br> 17) Max: 160.0 |  |

Displays the current IGBT temperature in degrees $C$, and as percentage of IGBT temp rating.

| VIEW-18: Ambient Temperature |  |
| :--- | :--- |
| Ambient Temp <br> 18) | Min: 0.0 |
| Max: 160.0 |  |

| VIEW-19: Power-On Time |  |
| :--- | :--- |
| Power-On Time <br> 19) | Min: 0 <br> Max: 4294967295 |

Displays the system time most significant digits: YY/MM/DD/HH/MM

VIEW-23: D1-SG Input

| D1-SG Input <br> 23) | $0-$ Open <br> $1-$ Closed |
| :--- | :--- |

Displays status of Digital Input 1.

| VIEW-24: D2-SG Input |  |
| :--- | :--- |
| D2-SG Input <br> 24) | - Open <br>  |

Displays status of Digital Input 2.

| VIEW-25: V1-V2 Input |  |
| :--- | :--- |
| V1-V2 Input <br> 25) | - Deenergized <br> $1-$ Energized |

Displays status of Voltage Input 1.

| VIEW-26: V3-V4 Input |  |
| :--- | :--- |
| V3-V4 Input | 0 - Deenergized |
| 26) | 1 - Energized |

Displays status of Voltage Input 2.

| VIEW-27: O1-O2 Output |  |
| :--- | :--- |
| O1-O2 Output <br> 27) | - Open <br> $1-$ Closed |

Displays status of Output Relay 1.

| VIEW-28: HOA Status |  |  |
| :--- | :--- | :---: |
| HOA Mode | $0-$ Off |  |
| 28) | 1 - Hand |  |
|  | 2 - Auto |  |
|  | 3 - Bluetooth |  |

Displays status of HOA selector.

| VIEW-37: Power |  |
| :--- | :--- |
| Average Power <br> $37)$ | Varies depending <br> on VFD size [kW] |

## VIEW-39: Target Frequency

| $\|$Target Frequency <br> 39) Min: PRIMARY-10 <br> Max: PRIMARY-9  <br> VIEW-40: Run Command Source   <br> Run Command 0 - None  <br> 40) - Run  <br>  2 -Terminals  <br>  3-3 Wire  <br>  4-Communication  <br>  5 - Mobile  |
| :--- |

| VIEW-41: Speed Reference Source |  |  |
| :--- | :--- | :---: |
| Speed Reference | 0 - None |  |
| 41) | 1 - Keypad |  |
|  | 2 - Analog 1A |  |
|  | 3 - Analog 2A |  |
|  | $4-$ Communication |  |
|  | 5 - Mobile |  |
|  | $6-$ PID |  |

States the current hardware configuration of the 1 A Analog Input (DIP switch selection)

## VIEW-48: 2A Type

| N/A |  |
| :--- | :--- |
| 48) | $0-0-10 \mathrm{~V}$ Input |
|  | $1-0-10 \mathrm{~V}$ Output |
|  | $2-4-20 \mathrm{~mA}$ Output |

States the current hardware configuration of the 2A
Analog Input/Output (DIP switch selection)

Displays status of Digital Input 3.

Displays status of Digital Input 4.

| VIEW-51: O3-O4 Output |  |
| :--- | :--- |
| 2A Type | 0 - Open |
| 51) |  |

Displays status of Relay Output 2 (N.C., form C).

| VIEW-52: O4-O5 Output |  |
| :--- | :--- |
| 2A Type | $0-$ Open |
| 52) | $1-$ Closed |

Displays the status of Relay Output 2 (N.O., form C).

| VIEW-53: 3A mA Input |  |
| :--- | :--- |
| 3A Input | Read Only |
| 53) |  |

Analog Input in mA.

## VIEW-128: Bluetooth Name

Bluetooth Name Default: XXXXXXXXX 128)

The Bluetooth name is the name that is being broadcast by the device. It is a portion of the Bluetooth key and is represented in base 36.

### 8.8 Fault Codes

FAULT-1: Fault

| FAULT-1: Fault |  |
| :--- | :--- |
| Fault | 0 - None |
| 1) | $1-$ Motor Overload (C) |
|  | $2-$ Motor Over Current |
|  | (C) |
|  | $4-$ VFD Over Heat (C) |
|  | $8-$ Input Phase Open |
|  | (L) |
|  | $9-$ Output Phase Open |
|  | (L) |
|  | $10-$ No Motor (L) |
|  | $11-$ Incorrect Output |
|  | Wiring |
|  | $12-$ Power Board |
|  | Uncalibrated |
|  | $13-$ Ground Fault (L) |
|  | $21-$ Bypass Motor |
|  | Overload (L) |
|  |  |

26 - Bypass Max Time
(L)

27 - Bypass Ground
Fault (L)
28 - Bypass
Communications Error
29 - Bypass Contactor
(L)

30 - Bypass Current at Power On (L)
31 - Bypass No Motor Current (L)
33 - Bypass
Unexpected Current (L)
41 - Limit Switch
42 - Damper Overload
(L)

43 - Control Reserved
44 - No Flow (L)
45 - External Trip (M)
47 - Control Board Error
(M)

48 - VFD Cooling Fan
(L)

50 - Overpressure (A) 51 - BMS
Communications Loss
(A)

52 - Analog Signal Loss
53 - Transducer Signal Loss (A)
54 - EEPROM Fail 55 - Calibration CRC Failed
56 - Bluetooth Key CRC Failed

Displays the fault type.
(C)- Critical type faults require long retry delay
(L)- Light type faults allow short retry delay
(M)- Faults require Reset4
(A)- Faults with Auto Reset/Restart abilities

At the end of Protection group there are separate retry parameters for (C) Critical and (L) Light faults

FAULT-4: Line U Current
Line U Current
Min: 0.0
4)

Max: 6x VFD FLA (A)

Displays the phase A output current at the time of the fault. Displayed upon VFD fault.

| FAULT-5: Line V Current |  |
| :--- | :--- |
| Line V Current Min: 0.0 <br> 5) Max: 6x VFD FLA (A) |  |

Displays the phase $B$ output current at the time of the fault. Displayed upon VFD fault.

## FAULT-6: Line W Current

| Line W Current <br> $6)$ | Min: 0.0 <br> Max: 6x VFD FLA (A) |
| :--- | :--- |

Displays the phase C output current at the time of the fault. Displayed upon VFD fault.

## FAULT-7: DC Bus Voltage 1

| DC Bus Voltage 1 | Min: 0.0 |
| :--- | :--- |
| Max: $1000(\mathrm{~V})$ |  |

Displays the DC bus voltage at time of the fault. Displayed and saved upon VFD fault.

FAULT-8: DC Bus Voltage 2

| DC Bus Voltage 2 <br> 8) | Min: 0.0 <br> Max: $1000(\mathrm{~V})$ |
| :--- | :--- |

Displays the DC bus voltage captured 100ms after the fault.

FAULT-9: Target Frequency

| FAULT-9: Target Frequency |
| :--- |
| Target Frequency |
| 9) Min: 0.0 <br>  Max: $240.00(\mathrm{~Hz})$ |

Displays the target frequency at the time of the fault. Displayed upon VFD fault.

FAULT-10: Output Frequency
Output Frequency
Min: 0.0
Max: $240.00(\mathrm{~Hz})$
10)

Displays the output frequency at the time of the fault. Displayed upon VFD fault.

FAULT-12: System Status

| System Status | $0-$ VFD stop |
| :--- | :--- |
| $12)$ | $1-$ VFD run |
|  | $2-$ VFD disabled |
|  | $3-$ VFD fault |
|  | $4-$ VFD shutdown |

|  | 5 - VFD fireman's |
| :--- | :--- |
|  | override |
|  | $6-$ VFD auto reset |
|  | $8-$ Power-on delay |
|  | $12-$ Signal loss |
|  | $14-$ PID run |
|  | $15-$ Open damper |
|  | $18-$ Bypass stop |
| $19-$ Bypass manual |  |
|  | $20-$ Bypass override |
|  | $22-$ Bypass auto on |
|  | fault |
|  | $23-$ Bypass disabled |
|  | $24-$ Bypass fault |
|  | $25-$ Bypass shutdown |
|  | $27-$ Bypass auto on |
|  | comms loss |

Displays the operating mode at the time of the fault. Displayed upon VFD fault.

| FAULT-11: Output Status |  |
| :---: | :---: |
| Output Status | $0-\mathrm{VFD}$ Off |
| 11) | 1-Accelerate |
|  | 2 - Decelerate |
|  | 3 - Steady |
|  | 4 - Speed search |
|  | 5 - Flying start |
|  | 6 - DC brake |
|  | 7 - Preheat |
|  | 8 - DC trip prevention |
|  | 9 - Stall prevention |
|  | 10 - Bypass off |
|  | 11 - Bypass run |

Displays the system output at the time of the fault.

| FAULT-13: HOA Mode |  |
| :--- | :--- |
| HOA Mode | 0 - Hand |
| 13) | 1 - Off |
|  | 2 - Auto |
|  | 3 - Bluetooth |

Displays status of the HOA switch at time of the fault. Displayed upon VFD or Bypass fault.

| FAULT-14: VFD Input Terminals |  |
| :--- | :--- |
| I/O Terminals <br> 14) | Min: 0x00 <br> Max: 0xFF |

Bit field of flags representing terminal inputs at the time of the fault. For bits $0-1$, a cleared flag will read "Open and a set flag will read "Closed". For bits 2-3, a cleared flag reads "DeEnergized" and a set flag reads "Energized". Displayed upon VFD or Bypass fault.
Bit 0 - Damper Status
Bit 1-0102 Status
Bit 2 - 0304 Status
Bit 3-0405 Status
Bit 10 - D4 Status
Bit 11 - D3 Status
Bit 12 - V3/V4 Status
Bit 13 - V1/V2 Status
Bit 14 - D2 Status
Bit 15 - D1 Status

## FAULT-15: IGBT Temperature

## IGBT Temperature $\quad$ Min: $0\left[{ }^{\circ} \mathrm{C}\right]$ 15) Max: $160\left[{ }^{\circ} \mathrm{C}\right]$

Displays the current Inverter temperature in degrees $C$ at the time of the fault. Displayed upon VFD fault.

FAULT-16: PCB Temperature

| Ambient Temperature | Min: $0\left[{ }^{\circ} \mathrm{C}\right]$ |
| :--- | :--- |
| 15) | Max: $160\left[{ }^{\circ} \mathrm{C}\right]$ |

Displays the current PCB temperature in degrees $C$ at the time of the fault. Displayed upon VFD fault.

## FAULT-33: Date

| Date <br> D3) <br> 33)$\|$DD/MMYYYY |
| :--- |

Displays the system date. Only the 3 least significant bytes are used. From least significant byte: day, month, year. Displayed upon VFD or Bypass fault.

Displays the system time. Only the 3 least significant bytes are used. From least significant byte: second, hour, day. Displayed upon VFD or Bypass fault.

### 8.9 Administration

| ADMIN-1: Reset Motor Run Time |  |
| :--- | :--- |
| Motor Run Time $0-$ No <br> 1)  | $1-$ Yes |

Resets the run time.

| ADMIN-2: Reset Wattmeter |  |
| :--- | :--- |
| Wattmeter <br> 2) | $0-$ No <br> $1-$ Yes |

Resets the accumulated value of the wattmeter.

## ADMIN-4: Product Type

| Product Type <br> $4)$ | 0 - VFD <br> $1-$ VFD-Bypass |
| :--- | :--- |

Indicates if VFD only or VFD with Bypass.

| ADMIN-5: VFD Model |  |
| :--- | :--- |
| VFD Model | 0 - QLNK-003-DV |
| 5) | 1 -QLNK-005-DV |
|  | 2 -QLNK-009-DV |
|  | 3 -QLNK-012-DV |
|  | 4 -QLNK-017-DV |
|  | 5 -QLNK-024-DV |
|  | 6-QLNK-028-DV |

Indicates base VFD model number.

## ADMIN-7: Contactor Model

| Contactor Model | $0-$ NONE |
| :--- | :--- |
| $7)$ | $1-$ MRC -9 |
|  | $2-$ MRC -12 |
|  | $3-$ MRC -18 |
|  | $4-$ MRC -22 |
|  | $5-$ MRC -32 |

Indicates contactor model on drives with Bypass.

| ADMIN-8: |  |  |

## CHAPTER 9 - TROUBLESHOOTING AND MAINTENANCE

The following troubleshooting information is also available via the Q-Link mobile app. When a fault occurs, the mobile app will offer the same potential remedies seen below for the corresponding faults in section 9.1.

### 9.1 Fault Remedy

| Fault | Cause | Remedy |
| :---: | :---: | :---: |
| Motor Overload (C) | A motor overload fault occurs when the overload sees more than the adjusted percentage of the FLA setting. This follows the industry-standard overload trip class curve, adjustable in PROTECTION-07 \& 08. | - Check that your FLA setting in PRIMARY-04 matches the motor nameplate <br> - For submersible pumps, check if there is a sand in the water. <br> - Check motor shaft spins freely <br> - For high inertia loads set higher acceleration time |
| Motor Over Current (C) | A motor overcurrent fault occurs when the overload sees more than the userdefined percentage of the FLA setting, adjustable in PROTECTION-12. This fault will trip after a short delay, adjustable in PROTECTION13. | - Check that your ACC time is high enough to allow for proper motor ramp-up <br> - Check that your FLA setting in PRIMARY-04 matches the motor nameplate <br> - Verify motor winding connections in junction box according manufacturer drawing. |
| - VFD Over Current (C) | A VFD overcurrent fault occurs when the overload sees more than $110 \%$ of the VFD's current rating. This is an instantaneous fault. | - Check that your ACC time is high enough to allow for proper motor ramp-up <br> - Check that your VFD is sized correctly to the motor load <br> - For submersible pumps, check that your motor max amps do not exceed the VFD's current rating. <br> - Check for an obstruction at the motor |
| VFD Over Heat (C) | A VFD overheat fault occurs when VFD's internal heat sink temperature limit is exceeded. This is an instantaneous fault. | - Check that the VFD fan vents are free of dirt and debris <br> - Check that the enclosure is providing adequate cooling air flow to the VFD |

| Fault | Cause | - Remedy |
| :---: | :---: | :---: |
| VFD Short Circuit (C) | A VFD short circuit fault occurs when there is an internal or external short circuit on the VFD output circuit. This is an instantaneous fault. | - Check if power line wiring is connected to VFD motor terminals <br> - Check that there are no shorts visible on the output circuit of the VFD <br> - Disconnect the motor wires at the VFD, disable the no motor protection in PROTECTION-03, and run the VFD with no load. If problem persists, then the VFD output is shorted internally. Consider replacing the VFD and don't forget to check the motor circuit also for shorts. This may have caused the damage and could possibly damage a newly installed VFD if not corrected. <br> - Check that there are no shorts in the wires running between your VFD and the motor |
| Over Voltage (L) | A VFD over voltage fault occurs when the VFD's internal DC bus voltage limit is exceeded. This is an instantaneous fault. | - Check that the measured line voltage matches the VFD rated voltage <br> - Check that the DEC time is adequately high to allow for slow ramp-down of the motor load. Decelerating too quickly can create harmful regenerative voltage. <br> - For fans and other high-inertia applications, it's best to use the "coast" stopping mode selectable in PRIMARY-30 to allow for gradual motor slowing <br> - For very high-inertia loads, consider installing a dynamic braking unit and braking resistor to absorb any excess regenerative voltage |

| Fault | Cause | - Remedy |
| :---: | :---: | :---: |
| Under Voltage (L) | A VFD under voltage fault occurs when the VFD's internal DC bus voltage low limit has not been met. | - Check that the measured line voltage matches the VFD rated nominal voltage <br> - Check your motor wiring <br> - Check the VFD's DC bus value before running a motor and while running a motor. If the voltage drops after a motor load has been applied, there may be a motor issue. <br> - Disconnect the motor wires at the VFD, disable the no motor protection in PROTECTION-03, and run the VFD with no load. If problem persists, then the VFD may have internal damage. <br> - Check the motor with a megger meter. If the motor tests fine, the VFD works fine with no load, and the DC bus still drops when a load is applied, check the line voltage to see if it may be an overloaded utility transformer causing the issue. If the line voltage is fine, consider replacing the VFD. |
| Input Phase Open (L) | Occurs when: The amplitude of DC bus ripples exceeds a set value. | - Ensure all wires of the input ( $\mathrm{R}, \mathrm{S}$, and $T$ ) are properly torqued. <br> - Ensure the VFD is receiving proper input Voltage to each phase. <br> - Ensure the utility power transformer is properly sized for VFD load. |
| Output Phase Open (L) | Occurs when: Any of the output phases ( $\mathrm{U}, \mathrm{V}$ or W ) has current less than the Output Phase Open Level (Protect-19). | - Check contactor at VFD output. <br> - Check output wiring ( $\mathrm{U}, \mathrm{V}$, and W ) from VFD to motor. <br> - Check motor disconnect if installed |
| No Motor (L) | Occurs when: All three phases have current below $15 \%$ of motor FLA for 250 ms . Motor circuit is open or has loose connection. | - Ensure Motor wires are properly torqued and wired to $\mathrm{U}, \mathrm{V}$, and W . <br> - Ensure output disconnect is turned one if a disconnect is installed between VFD and Motor. <br> - If the VFD is being tested without a motor, ensure Protect-03 is No. |

| Fault | Cause | - Remedy |
| :---: | :---: | :---: |
| Ground Fault (L) | Occurs when: Ground fault current exceeds the internal ground fault level value. | - Ensure Motor and VFD are grounded per the installation guide. <br> - Disconnect motor wires from package and Check the output wiring and insulation of motor windings with Megger tester. |
| Bypass Motor Overload | The Bypass Motor Overload protection provides motor overload protection when in Bypass mode only. If the motor pulls more current than set motor FLA, it will trip based on selected trip class to prevent motor damage. | - Check FLA, Trip Class, <br> - Check if motor is overloaded |
| Bypass Phase Loss | The bypass did not see current in one or more of the phases. | - Check wiring passing through the bypass current sensors for loose connections. |
| Bypass Board Error | The bypass board error is a "hard fault" and requires that the board be power cycled to clear it. | - If Power cycle does not clear the fault, please consult factory |
| Bypass Stall | The Stall fault occurs when the current exceeds $300 \%$ of set FLA for 0.5 sec and the current slope is not decreasing. (Not active during startup). | - Check FLA settings. <br> - Check if motor is overloaded. <br> - Check for mechanical issues (bad bearings, bad gears or belts) <br> - If nothing helps Adjust stall level higher. (Default is 300\%) |
| Bypass Max Time to Start | A max time to start trip occurs if the motor current has not decreased below FLA 10 seconds after start. | - Check that your FLA setting in PRIMARY-04 matches the motor nameplate <br> - Check the motor and system for mechanical issues <br> - Check your dip switch settings <br> - Check power wiring for loose connection. |
| Bypass Ground Fault | A Ground Fault occurs when bypass module determines that there is a motor ground leak current. | - Disconnect motor leads from bypass package and test insulation with Megger <br> - If Megger reading shows low insulation, check motor wiring and motor junction box for damaged wire insulation and moisture |

| Fault | Cause | - Remedy |
| :---: | :---: | :---: |
| Bypass <br> Communications Error | Bypass communication error occurs when the Bypass and I/O board loses the connection between them. | - Check the connection between the Bypass board and the I/O board, that the connector is firm and that it is in the correct socket. <br> - Also check condition of wire that there are no insolation issues along it's length. |
| Bypass Contactor | A Bypass Contactor trip occurs when there is an issue with the contactors. It usually indicates that either motor is disconnected or contactor didn't pull in or contactor coil pulls too much current and activated 24VDC power overload protection or it is disconnected. | - Check that a motor is hooked up to the contactor output. <br> - Ensure contactor is FCS brand and properly sized for application <br> - Check for contactor coil connection to bypass board <br> - Check for shorts in the contactor coil or in the wiring to the contactor. <br> - Disconnect contactor coil and check voltage coming from control board. If during bypass run mode there is no voltage, stop bypass and wait for a few minutes for overload to cooldown and check again 24VDC power during run mode. |
| Bypass Current at Power On | Bypass measures the current at power on with the contactors open, if there is current ( $>0$ ) this fault is triggered. | - Check for proper motor wiring through the Bypass current sensors. <br> - Check for contactor that is locked closed. <br> - Check for proper calibration of the bypass unit. |
| Bypass No Motor Current | Bypass measures the current when in running state. If there is no measured current $(0)$ then this fault is triggered. | - Check for proper motor wiring through the Bypass current sensors. <br> - Check for contactor that is locked open. <br> - Check for proper calibration of the bypass unit. |
| Bypass Locked Rotor | A locked rotor fault occurs when during start current exceeds $300 \%$ of the FLA setting and it is not decreasing after 0.5 seconds. | - Check that your FLA setting in PRIMARY-04 matches the motor nameplate <br> - Check if the motor spins freely or if motor shaft is locked. <br> - Check wiring in motor junction box. <br> - Check phase sequence for proper rotation direction for systems with mechanically blocked reverse rotation. <br> - Monitor PF (Power Factor) reading at start. If it is less than 0.2 and does not change, call tech support to check wiring. |

| Fault | Cause | - Remedy |
| :---: | :---: | :---: |
| Limit Switch | Occurs when: The Damper Switch input is not detected within an adjustable time delay (VFD-07) when using Damper Mode (VFD-06). | - Ensure a Damper switch is being used and wired to appropriate Digital Input set for Damper Switch. Ensure the Damper Time Delay (VFD-07) is set to a longer time than it normally takes to open the Damper and close the Damper Switch. |
| Damper Overload (L) | Occurs when: The Damper current exceeds 0.5A | - Ensure rating of the Damper Motor does not exceed 0.5A <br> - Ensure Damper is not blocked or stuck and is free-moving. |
| No Flow (L) | When flow switch is open for time delay during no flow condition in VFD run mode, VFD will trip. | - Check if time delay is not long enough to provide flow during start <br> - Check if there is a suction pressure or water in well. <br> - Check if pump did not fail |
| - External Trip (M) | Occurs when: any digital input set for EXT TRIP is activated. | - Resolve reason for external trip signal. <br> - Disconnect trip signal connection to digital input. |
| Power Board Error (M) | Indicates a problem with the power board. | - Consult factory |
| Control Board Error $(\mathrm{M})$ | Indicates a problem with the firmware. When it happens, the control board reboots and this faults immediately. | - Consult factory |
| VFD Cooling Fan (L) | Fan is either unplugged, damaged, or has slowed down significantly | - Check it's plugged in, clean it, or replace it. Fan is rated at 3800 RPM and the fault triggers below 2280. |
| Power Board Communications Error (M): |  | - Consult factory |
| Overpressure (A) | Occurs when: System pressure exceeds over pressure trip level setting. | - Check over pressure level in: Primary-64 <br> - Can be caused by pressure overshooting because P-Gain setting is too high. Decrease P-Gain value if necessary. <br> - Check if pump is oversized for the application and demand changes rapidly. |
| BMS Communications Loss (A) | Occurs when: Run Command Source or Speed Source is set to Comms, and the signal is not detected | - Check wiring and signal from BMS system to VFD <br> - Verify that BMS is sending proper run command and/or speed signal |

| Fault | Cause | - Remedy |
| :---: | :---: | :---: |
| Analog Signal Loss (A) | Occurs when speed signal is less than minimum value for Speed Reference Signal Loss Delay Time | - Check wiring and speed signal to VFD <br> - Check Min Value: I/O-14, I/O-19, I/O-24 <br> - Check signal Loss Delay: PRIMARY45 |
| Transducer Signal Loss <br> (A) | Occurs when: signal is below minimum value $O R$ at maximum value for Feedback Loss Delay time. | - Verify wiring and signal from transducer <br> - Check signal input value: VIEW-31, VIEW-35 (4-20 mA) or VIEW-32, VIEW-34 (0-10V) <br> - Check Min Value: I/O-14, I/O-19, I/O-24 <br> - Check signal Loss Delay: PRIMARY62 |
| EEPROM Fail |  | - Consult factory |
| Calibration CRC Failed |  | - Consult factory |
| Bluetooth Key CRC Failed |  | - Consult factory |
| Invalid Firmware | Occurs when software in power, control, and bypass boards are not compatible. | - Download firmware package from the Q-Link Companion App |

### 9.2 Fan Replacement

### 9.3 Battery Replacement

## CHAPTER 10 - MODBUS- RTU COMMUNICATION

### 10.1 Introduction

The VFD can be controlled and monitored through the Modbus RTU protocol over an RS-485 connection. Modbus follows a simple client-server model. Server devices perform data read/write requests which are issued from a client device such as a PLC or building management system. Assignable addresses for server devices range from an address of 1 to a theoretical maximum of 247.

As a server device, the VFD communicates all data using only 16-bit holding registers. Addressing for the registers is partitioned into blocks that are multiples of 100 to group functionally similar data. If the drive is configured to accept commands via remote communications, it can be commanded to start, stop, run at a specified output frequency, target a setpoint in PID control, and reset faults.

Modbus addresses can be found in Chapter 7 - Parameter Lists

## CHAPTER 11 - BACnet- MS/TP COMMUNICATION

### 11.1 Introduction

The VFD can be controlled and monitored through the BACnet MS/TP protocol over an RS-485 connection. The VFD operates as an MS/TP master device, which the protocol can support addressing for up to 128 master devices in a single MS/TP network.

BACnet conveys control and monitoring data as a collection of BACnet objects. The VFD supports Analog Input, Analog Value, Positive Integer Value, Binary Input, Multi-State Value, and Character String object types. The Read Property and Write Property services can be used to interface to these objects. If the drive is configured to accept commands via remote communications, it can be commanded to start, stop, run at a specified output frequency, target a setpoint in PID control, and reset faults.

### 11.2 Parameter Code Lists

Analog Input Object:

| BACnet <br> Object <br> Instance | Read/ <br> Write | Full Parameter Name | OLED Display Name | Units | Parameter Setting Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | R | PID Feedback Value | PID Feedback | $\begin{gathered} 0.1 \\ {[\text { Unit] }} \end{gathered}$ | 0.0 to 6000.0 |
| 1 | R | 2nd Input Value (Units) |  | [Unit] | 0.0 to 3000.0/ 0.00 to 3000.00 |
| 2 | R | Inverter temperature | IGBT Temp | $\begin{gathered} {\left[{ }^{\circ} \mathrm{C}\right] /} \\ \% \end{gathered}$ | 0 to 160 /0-100 |
| 3 | R | PCB temperature | Ambient Temp | [ ${ }^{\circ} \mathrm{C}$ ] | 0 to 160 |
| 4 | R | 1A mA Input |  | $\begin{gathered} \mathrm{mA}{ }^{*} \\ 100 \end{gathered}$ | N/A (Read only) |
| 5 | R | 1A V Input | 1A Input | x | 0.00 to 24.00 |
| 6 | R | 2A V Input | 2A Input | X | 0.00 to 10.00 |
| 7 | R | 2A mA Output |  | x | . 00 to 20.00 |
| 8 | R | 2A V Output |  | x | 0.00 to 10.00 |
| 9 | R | Power | Average Power | [kW] | varies depending on VFD size |
| 10 | R | 3A mA Input | 3A Input | $\begin{gathered} \mathrm{mA} * \\ 100 \end{gathered}$ | N/A - Read only |

## Analog Value Object:

| BACnet <br> Object <br> Instance | Read/ <br> Write | Full Parameter Name | OLED Display Name | Units | Parameter Setting Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | R/W | Rated Motor Voltage | Motor Voltage | [V] | ```200/400V model: 200 to 480V; def 230V 400V model: 380 to 480V; def 460V``` |
| 1 | R/W | Rated Motor HP/kW | Motor Horsepower | $\begin{gathered} {[\mathrm{HP} / \mathrm{k}} \\ \mathrm{W}] \end{gathered}$ | 1 to 600HP/ 0.75 to 450kW |
| 2 | R/W | Rated Motor Current | Motor Current | $\begin{aligned} & 0.1 \\ & {[\mathrm{~A}]} \end{aligned}$ | 1.0 to VFD Rating |
| 3 | R/W | Maximum Frequency | Max Frequency | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 30.00 to 240.00 |
| 4 | R/W | Base Frequency | Base Frequency | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 30.00 to VFD Max Hz |
| 5 | R/W | High Frequency Limit | High Frequency Limit | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | VFD Low Hz Limit to VFD Max Hz |
| 6 | R/W | Low Frequency Limit | Low Frequency Limit | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.50 to VFD High Hz Limit |
| 7 | R/W | Carrier Frequency | Carrier Frequency | $\begin{gathered} 0.1 \\ {[\mathrm{kHz}]} \end{gathered}$ | 2.0 to 10.0 |
| 8 | R/W | Keypad Frequency | Keypad Frequency | $\begin{gathered} 0.01[ \\ \mathrm{Hz}] \end{gathered}$ | VFD Low Hz to VFD High Hz Limit |
| 9 | R/W | Power-On Run Delay | Power-On Run Delay | 1[Sec] | 0 to 9999 |
| 10 | R/W | Acceleration Time | Acceleration Time | $\begin{gathered} 0.1 \\ {[\mathrm{sec}]} \end{gathered}$ | 1.0 to 6000.0 |
| 11 | R/W | Deceleration Time | Deceleration Time | $\begin{gathered} 0.1 \\ {[\mathrm{sec}]} \end{gathered}$ | 1.0 to 6000.0 |
| 12 | R/W | Ref. Loss Delay** | Anlg Ref Loss | 1[Sec] | 0 to 20 |
| 13 | R/W | PID Feedback Max* | Feedback Max | $\begin{gathered} 0.01 \\ \text { [Unit] } \end{gathered}$ | 0.0 to 6000.0 |
| 14 | R/W | PID Keypad Setpoint* | Keypad Setpoint | $\begin{gathered} 0.01 \\ {[\text { Unit] }} \end{gathered}$ | 0.0 to 95\% of [PID F/B Max] |
| 15 | R/W | PID P-Gain* | P Gain | 1 [\%] | 0 to 999 |
| 16 | R/W | PID I-Gain* | I Gain | $\begin{gathered} 0.1 \\ {[\mathrm{sec}]} \end{gathered}$ | 0.1 to 32.0 |
| 17 | R/W | PID Out Ramp Time* | PID Ramp Time | $\begin{gathered} 0.1 \\ {[\mathrm{sec}]} \end{gathered}$ | 0.0 to 10.0 |
| 18 | R/W | PID High Frequency Limit * | PID High Freq Limit | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | [Prime-59] to [Prime-07] |
| 19 | R/W | PID Low Frequency Limit * | PID Low Freq Limit | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.00 to [Prime-58] |
| 20 | R/W | Skip Frequency 1 Low* | Skip Freq 1 Low | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.50 to [Skip-1 High Hz] |
| 21 | R/W | Skip Frequency 1 High* | Skip Freq 1 High | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | [Skip-1 Low Hz] to [VFD Max Hz] |

| BACnet <br> Object <br> Instance | Read/ <br> Write | Full Parameter Name | OLED Display Name | Units | Parameter Setting Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 22 | R/W | Skip Frequency 2 Low* | Skip Freq 2 Low | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.50 to [Skip-2 High Hz] |
| 23 | R/W | Skip Frequency 2 High* | Skip Freq 2 High | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | [Skip-2 Low Hz] to [VFD Max Hz] |
| 24 | R/W | Skip Frequency 3 Low | Skip Freq 3 Low | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.50 to [Skip-3 High Hz] |
| 25 | R/W | Skip Frequency 3 High | Skip Freq 3 High | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | [Skip-3 Low Hz] to [VFD Max Hz] |
| 26 | R/W | Preset Frequency-A | Speed A | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | VFD Low Hz Limit to VFD Max Hz |
| 27 | R/W | Preset Frequency-B | Speed B | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | VFD Low Hz Limit to VFD Max Hz |
| 28 | R/W | Preset Frequency-AB | Speed AB | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | VFD Low Hz Limit to VFD Max Hz |
| 29 | R/W | Preset Setpoint-A | Setpoint A | $\begin{gathered} \text { 0.1/0. } \\ 01 \\ \text { [Unit] } \end{gathered}$ | 0.00 to F/B Max Value*0.95 |
| 30 | R/W | Preset Setpoint-B | Setpoint B | $\begin{gathered} \text { 0.1/0. } \\ 01 \\ \text { [Unit] } \end{gathered}$ | 0.00 to F/B Max Value*0.95 |
| 31 | R/W | Preset Setpoint-AB | Setpoint AB | $\begin{gathered} \hline 0.1 / 0 . \\ 01 \\ \text { [Unit] } \\ \hline \end{gathered}$ | 0.00 to F/B Max Value*0.95 |
| 32 | R/W | 1A mA Min Value | 1A Input Min mA | $\begin{aligned} & 0.01 \\ & {[\mathrm{~mA}]} \end{aligned}$ | 0.00 to 20.00 |
| 33 | R/W | 1A Min Hz | 1A Min Hz | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \\ & \hline \end{aligned}$ | 0.00 to [Prime-07] |
| 34 | R/W | 1A mA Max Value | 1A Input Max mA | $\begin{gathered} 0.01 \\ {[\mathrm{~mA}]} \end{gathered}$ | 0.00 to 20.00 |
| 35 | R/W | 1A Max Hz | 1A Max Hz | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.00 to [Prime-07] |
| 36 | R/W | 1A V Min Value | 1A Input Min V | $\begin{gathered} 0.01 \\ {[\mathrm{~V}]} \\ \hline \end{gathered}$ | 0.00 to 10.00 |
| 37 | R/W | 1A V Max Value | 1AInput Max V | $\begin{gathered} 0.01 \\ {[\mathrm{~V}]} \end{gathered}$ | 0.00 to 10.00 |
| 38 | R/W | 2A V Input Min Value | 2A Input Filter | $\begin{gathered} 0.01 \\ {[\mathrm{~V}]} \\ \hline \end{gathered}$ | 0.00 to 10.00 |
| 39 | R/W | 2A V Input Min Hz | 2A Min Hz | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.00 to [Prime-07] |
| 40 | R/W | 2A V Input Max Value | 2A Input Max V | $\begin{gathered} 0.01 \\ {[\mathrm{~V}]} \end{gathered}$ | 0.00 to 10.00 |
| 41 | R/W | 2A V Input Max Hz | 2A Max Hz | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.00 to [Prime-07] |
| 42 | R | VFD Output Frequency | Output Frequency | $\begin{aligned} & 0.01 \\ & {[\mathrm{~Hz}]} \end{aligned}$ | 0.00 to 240.00 |

| BACnet <br> Object <br> Instance | Read/ <br> Write | Full Parameter Name | OLED Display Name | Units | Parameter Setting Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 43 | R | Average Output Current | Average Current | $\begin{aligned} & 0.1 \\ & {[\mathrm{~A}]} \end{aligned}$ | 0.0 to 6xVFD FLA |
| 44 | R | Line U Current | Line U Current | $\begin{aligned} & 0.1 \\ & {[\mathrm{~A}]} \end{aligned}$ | 0.0 to 6xVFD FLA |
| 45 | R | Line V Current | Line V Current | $\begin{aligned} & 0.1 \\ & {[\mathrm{~A}]} \end{aligned}$ | 0.0 to 6xVFD FLA |

## CHAPTER 12 - WARRANTY

The Warranty period is 60 months after the date of invoice when used in a variable torque application. Detailed warranty terms and conditions are available from Franklin Control Systems or can be found at www.franklin-controls.com

## IN-WARRANTY service information

If the defective part has been identified under normal and proper use within the guarantee term, contact your local authorized Franklin Control Systems distributor or Franklin Control Systems Service center.

## OUT-OF WARRANTY service information

Franklin Control Systems warranty will not be applied in the following cases, even if the guarantee term has not expired.

- Damage was caused due to misuse, negligence or accident.
- Damage was caused due to abnormal voltage and/or peripheral device malfunction (failure).
- Damage was caused due to improper repair or alteration by any individual or organization other than Franklin Control Systems authorized distributor or service center.
- Damage was caused due to earthquake, fire, flooding, lightning, or any other form of natural calamity.
- Franklin Control Systems nameplate is no longer attached.
- The warranty guarantee period has expired.

## APPENDIX A - DE-RATING TABLE

DE-RATING:

The following de-ratings are established based on the ambient and adjustable carrier frequency. Where applicable, linear interpolation of the rated output current is allowed for carrier frequencies between 5 kHz and 10 kHz .

| Model No. | INPUT | OUTPUT |  | Ambient Temperature <br> (C) |
| :---: | :---: | :---: | :---: | :---: |
|  | Amps (VT) | Amps (VI) | $\begin{gathered} \text { Carrier } \\ (\mathrm{KHz}) \\ \hline \end{gathered}$ |  |
