

## 1 WIRELESS

Our fully battery-powered alarms communicate via the 2G, 3G and 4G networks, eliminating the need for any hazardous or cumbersome cables. That means easy installation and reconfiguration.

## 2 DUAL BEAM

The units feature motion sensors with dual-beam, animal-immune detectors designed to accurately detect warm objects, such as people and vehicles, without false activations due to wildlife and weather.

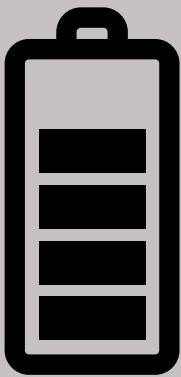

## 3 IMAGE ILLUMINATION

Each camera can detect and fully illuminate an intruder up to 20 metres away – even in total darkness. In seconds, RaiderVision sends video to monitoring and control room staff.

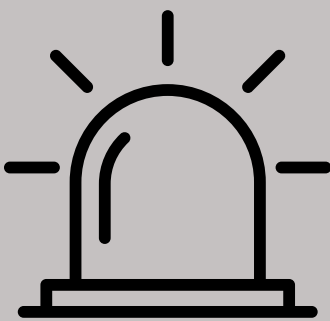

## 4 ARMoured

RaiderVision units are fully armoured with steel to prevent damage from hazardous environments.

## 5 SELF-REGULATING

Our control room staff perform regular system efficacy checks, including reviewing signal strengths and battery voltages. When the units' batteries are low (usually after about a year), they send an alert to staff so that they can be changed.

## 6 HIGH-VOLUME ALARM

In over 99% of confirmed unit activation cases, RaiderVision's high-volume alarm scares off potential intruders, and no further action is necessary.

## 7 24/7 MONITORING

RaiderVision can be controlled remotely, 24/7, by staff in our BS50518-accredited Alarm Receiving Centre (ARC). If an alarm is confirmed, staff deploy an SIA-certified rapid response guard and call the police.
